

THE REVOLUTIONARY GOVERNMENT OF ZANZIBAR

Main Report

2019/20 Household Budget Survey

**Office of the Chief Government Statistician
Ministry of Finance and Planning
Zanzibar**

December, 2020

WORLD BANK

FOREWORD

The 2019/20 Household Budget Survey (HBS) is the fifth in a series of national household budget surveys conducted by the Office of the Chief Government Statistician (OCGS) since early 1990's. It follows the previous surveys conducted in 2014/15, 2009/10, 2004/05 and 1992. The main objective of the HBS is to collect and consolidate information required for monitoring the progress towards national poverty reduction strategies that include understanding the efficiency of development policies, programs and projects geared towards improving households' living standards. The scope of the survey also covers gathering information related to private households on economic activities, household income and expenditure, housing characteristics and asset ownership. Similarly, the 2019/20 HBS helps in evaluating Zanzibar's performance in relation to the United Nations Sustainable Development Goals (SDGs), as well as, regional development strategies.

A successful completion of the 2019/20 HBS involved a series of consultative processes which included field visits to various stakeholders and the review of relevant policy documents. A total of 2,804 participating households from 235 enumeration areas were interviewed throughout Unguja and Pemba islands using digitalized information tools to ensure the accuracy and quality of the data.

The 2019/20 HBS, therefore, provides valuable information to update the National Accounts Weighting Systems, as well as, a new commodity basket with updated expenditure weights to be used in calculating the Consumer Price Index (CPI). This report presents a detailed analysis of poverty and non-poverty indicators at the national, rural-urban and district levels of Zanzibar. To highlight the trends and understand the results overtime, the 2019/20 HBS results have been compared with the 2014/15 and 2009/10 surveys for majority of the chapters in this document.

It is our expectation that this report will facilitate planning processes within the Government and the business community, and stimulate further research and in-depth analysis of various social and economic sectors. The report also serves as a source of useful information to planners and policymakers, non-governmental organizations, academicians and other stakeholders, including national, regional and international organizations.

.....
Hon. Jamal Kassim Ali,
Minister,
President's Office - Finance and Planning,
Zanzibar.

ACKNOWLEDGMENTS

The successful implementation of the 2019/20 HBS required substantial technical, institutional and financial assistance from key organizations and individuals whose contributions I want to acknowledge. Firstly, we wish to extend our appreciations to the World Bank, UNICEF, UNDP-(ZJP), UN-WOMEN and Bank of Tanzania (BOT) for their technical and financial supports throughout the survey. Our special gratitude goes to Nathan Price, Ahmad Mohammed and Sylvia Meku for their support in sampling; Dr Sasun Tsurunyan for poverty computation; and Rob Swinkels for his technical inputs. We indeed wish to thank Ms. Edith Mbatia and Ms. Montserrat Pejuan (from UNICEF), as well as, Ms. Rukia Wadoud (from UNDP) for their technical advice throughout the implementation of the 2019/20 HBS.

We wish to deliver our special thanks to the OCGS staff for playing pivotal roles in data collection and analysis. We also wish to extend a special word of thanks to the authors of this report including; Mr. Abdulmajid Jecha Ramadhan, Ms. Khadija Kh. Hamad, Ms. Fahima Mohammed Issa, Mr. Juma Omar Ali, Ms. Sabina R. Daima, Ms. Kazija Khamis Said, Mr. Kombo Mdachi, Mr. Said Mohammed, Mr. Ahmad Mohamed, Mr. Abdul Malik, Ms. Amina Mawazo, Ms. Ramla Hassan Pandu, Mr. Fadhil Ali Hassan, Mr. Yussuf Ali Hassan, Ms. Asia Hassan Mussa, Mr. Othman Ali Khamis, and Mr. Mwalimu Juma. We also acknowledge the roles played by Mr. Abdullah Othman, Mr. Hashim Uzia and Ms. Aisha Mohamed on effective data management and quality assurance and the current ODI Fellow Mr. Francis Lavoe for his support during data analysis and report writing.

The OCGS is finally grateful to the participating households for their hospitality, cooperation and time dedicated to host several visits made by enumerators, especially during data collection. Our gratitude also goes to the District Officers, field staff and Local leaders (Shehas) for their continuous support in mobilizing the respondents and making the data collection process possible.

Mayasa M. Mwinyi,
Chief Government Statistician,
Zanzibar

EXECUTIVE SUMMARY	XX
Results of Poverty using a Welfare Measure:.....	xx
Results of Poverty using Non-welfare Measures:.....	xxi
Other Chapters within HBS.....	xxii
CHAPTER ONE	1
INTRODUCTION	1
1.0 Overview.....	1
1.1 Objective.....	1
1.2 Survey Implementation.....	1
1.2.1 Methodology.....	2
1.2.2 Sample Size and Allocation.....	2
1.3 Improvement.....	2
1.3.1 Methodology changes.....	2
1.3.2 Additional Modules and Questions.....	3
1.4 Questionnaire.....	3
1.5 Pre-test and Pilot.....	4
1.5.1 Pre-test.....	4
1.5.2 Pilot.....	4
1.6 Listing, Recruitment and Training.....	4
1.7 Data collection.....	4
1.7.1 Data Management.....	4
1.7.2 Response Rate.....	4
1.8 Concepts and Definitions.....	4
CHAPTER TWO:	7
HOUSEHOLD DEMOGRAPHIC COMPOSITION	7
2.1 Introduction.....	7
2.2 Household Composition and Household Size.....	7
2.2.1 Population Size.....	8
2.2.2 Sex ratio.....	11
2.3 Dependency Ratio.....	12
2.4 Marital Status.....	13
2.5 Household Headship.....	15
2.6 Survival of Parents.....	19
2.7 Birth Registration or Notification.....	21
CHAPTER THREE:	23
EDUCATION AND HEALTH	23
3.1 Introduction.....	23
3.2 Education.....	23
3.2.1 Literacy Rates.....	23
3.2.2 Illiteracy Rates.....	25
3.2.3 Education Level.....	26
3.2.4 Enrolment Ratio.....	30
3.2.5 School Attendance and Dropout Rates.....	34
3.2.6 Distance to School and Mode of Transport.....	37

3.3	Health.....	41
3.3.1	Health Status	41
3.3.2	Type of Illness or Injury.....	43
3.3.3	Disability	46
3.3.4	Consultations.....	46
3.3.5	Reasons for not using medical services.....	49
3.3.6	Distance to Health Facilities	50
3.3.7	Problems During Medical Visits	51
3.3.8	Expenditure on Health Services	52
CHAPTER FOUR:.....		54
HOUSING DWELLINGS, DURABLES AND WATER AND SANITATION.....		54
4.1	Introduction.....	54
4.1.1	Construction Materials of Floors, Walls and Roofs	54
4.1.2	Tenure and Ownership.....	55
4.1.3	Connection to Electricity.....	56
4.1.4	Energy Sources for Cooking and Lighting.....	57
4.1.5	Ownership of Durable Goods.....	59
4.2	Water and Sanitation	59
4.2.1	Introduction.....	59
4.2.2	Access to Improved Drinking Water.....	60
4.2.3	Distance to and Time Taken for Collecting Drinking Water	61
4.2.3	Water Collectors	64
4.2.4	Toilet and Hand Washing Facilities	64
4.2.4	Stools and Garbage Disposal.....	66
CHAPTER FIVE:		68
ECONOMIC ACTIVITY STATUS AND AGRICULTURAL ACTIVITIES.....		68
5.0	Introduction.....	68
5.1	ECONOMIC ACTIVITY STATUS.....	68
5.1.1	Working age population.....	68
5.1.2	Persons by Main Activity.....	68
5.1.4	Employed Population by Occupation and Monthly Salary	70
5.1.5	Employed Persons by Industry.....	72
5.1.6	Employed Persons by Employment Status.....	73
5.1.7	Unemployed Persons.....	75
5.2.1	Proportion of Households Owning and Using Land	75
5.2.2	Agricultural Tools and Livestock Assets	79
5.2.3	Livestock.....	80
5.2.4	Goat Population.....	81
5.2.5	Sheep Population.....	82
5.2.6	Chicken Population.....	82
5.2.7	Livestock Products.....	83
5.2.8	Eggs Production	84
5.2.9	Sex of Decision Maker on Income from Agriculture	85
CHAPTER SIX:		86
HOUSEHOLD CONSUMPTION AND EXPENDITURE.....		86
6.1	Introduction.....	86
6.2	Trends in Average Consumption Levels using the Old Methodology	86
6.3	Examining the Type of Expenditure, Old Methodology	87
6.4	Trends in Average Consumption Levels using the New Methodology.....	89
6.5	Examining the Type of Expenditure using the New Methodology	89

6.6	Adult Equivalent Consumption Expenditure	90
CHAPTER SEVEN:.....		92
INCOME POVERTY AND INEQUALITY		92
7.1	Introduction.....	92
7.2	Basic Needs Poverty Headcount Rate by Area and District.....	92
7.3	Food Poverty Headcount Rate by Area and District	93
7.4	Trends in Poverty Reduction.....	94
7.5	Poverty Gap.....	97
7.6	Clustering Around the Poverty Line	98
7.7	Who has gained from increased consumption?.....	99
7.8	Inequality	100
7.9	Other Measures of Inequality.....	103
CHAPTER EIGHT		105
A POVERTY PROFILE.....		105
8.1	Introduction.....	105
8.2	Poverty and Demographic Characteristics of the Household.....	105
8.3	Poverty and Economic Characteristics.....	108
8.4	Poverty and Human Development Characteristics.....	112
8.5	Poverty and Access to Utilities	114
8.6	Child Poverty in Zanzibar.....	114
CHAPTER NINE:		117
HOUSEHOLD NON-AGRICULTURAL BUSINESS AND INDIVIDUAL INCOME		117
9.1	Introduction.....	117
9.2	Households Running their Own Business	117
9.3	Business Premises	117
9.4	Ownership Status	118
9.5	Source of Start-Up Capital.....	118
9.6	Expenditure on Inputs for the Business.....	119
9.7	Non-wage income (Remittance and Assistance).....	121
9.8	Main Source of Business Income.....	122
9.9	Capital Investment in Business	122
9.10	Other Non-Capital Business Expenditure	123
9.11	Business Registration, Tax Payment and Record Keeping	123
9.12	Employment Status: Household and Non-Household Members.....	124
9.13	Payment to Non-Household Employees, Cash and In-Kind	125
9.14	Non-Salary Sources of Income at the Individual Level	125
CHAPTER TEN:.....		127
TRIPS FOR BUSINESS AND RECREATION		127
10.1	Introduction.....	127
10.2	Taking at least one trip overnight in the last 12 months.....	127
10.3	Number of Nights Spent on a Trip.....	129
10.4	Purpose of the Trip.....	130
10.5	Average Expenditure (TZS) on Personal and Business trips	132
CHAPTER ELEVEN:.....		134
FOOD SECURITY AND NUTRITION.....		134
11.1	Introduction.....	134
11.2	Main Source of Household Food	134

11.3	Usual Number of Meals in the households	135
11.4	Proportion of Households Receiving Fewer Meals than Usual.....	136
11.5	Food Consumption Score (FCS)	137
11.6	Frequency of Food Consumption by Food Item and Area in the Preceding Week	138
11.7	Frequency of Food Consumption by Food Groups, Area and Districts in the Preceding Week	139
11.8	Consumption of Food items Rich in Vitamin A, Protein and Iron.....	140
CHAPTER TWELVE.....		141
GENDER AND TIME USE		141
12.1	Gender.....	141
12.1.1	Introduction.....	141
12.1.2	Education	141
12.1.3	Participation Rate in Organized Learning (one year before the official primary entry age)	142
12.1.4	Participation Rate of Youth and Adult in Formal and Non-Formal Education and Training by sex	143
12.1.5	Proportion of population in a given age group achieving at least a fixed level of proficiency in functional (a) literacy and (b) numeracy skills by Sex; 2019/20.....	144
12.1.6	Employment	146
12.1.7	Unemployed persons	147
12.1.8	Unemployed Persons by Education Level.....	148
12.1.9	Information and Communication Technologies	149
12.1.10	Proportion of Population who use the Internet	150
12.1.12	Ownership of Resources.....	152
12.1.13	Secure Right of Agricultural Land	153
12.1.14	Decision Making	154
12.2	TIME USE	155
12.2.1	Introduction.....	155
12.2.2	Average Time Spent by Sex.....	156
12.2.3	Average Time Spent by Sex and Residence.....	157
12.2.4	Average Time Spent by Sex and District	158
12.2.5	Average Time Spent by Sex and Age Group	159
12.2.6	Average Time Spent by Sex and Marital Status.....	160
12.2.7	Total Time Spent (per year) for Unpaid Domestic and Care Works	160
CHAPTER THIRTEEN:		162
INTERNAL MIGRATION		162
13.1	Introduction.....	162
13.2	Population and Migration.....	162
13.3	Migration Stock.....	162
13.4	Internal migration.....	163
13.5	Reason for Internal migration	165
13.5.1	Reason for Internal migration and sex	166
13.5.2	Reasons for internal migration and age.....	166
13.6	Internal migration and duration of stay	168
13.6.1	Internal migration, duration of stay and Area	169
13.6.2	Internal migration, duration of stay and sex.....	170
13.6.3	Internal migration, duration of stay and age.....	170
13.6.4	Internal migration, duration of stay and District	171
13.7	In-Migration and Out-Migration by district of Birth.....	172
13.8	Current Migration by Place of District of Residence	172
13.9	District proportion of internal migration by Place of birth.....	173
13.9.1	Districts contributions to internal migration by Place of birth.....	174
13.10	Index of Relative Representation (IRR).....	175

CHAPTER FOURTEEN:	176
TRANSFER OF GOODS AND SERVICES / REMITTANCES	176
14.1 Introduction.....	176
14.1.1 Remittance Recipient Households	176
14.1.2 Remitters Sending Money or Items from Abroad in 2018	176
14.1.3 Relationship to Remitter	177
14.1.4 Period Remitter has Lived Abroad	178
14.1.5 Age and Marital Status of Remitters	178
14.1.6 Level of Education of Remitters.....	179
14.1.7 Labour Status of Remitters	179
14.1.8 Remittance Channels	180
14.1.9 Remittance by Type.....	180
14.1.10 Reason for Use of Remittance Channels	181
14.1.11 Remittances by Source of the Country	182
14.1.12 Frequency of Cash Remittance Receipts	182
14.1.13 Uses of Remittances	183
14.1.14 Remittances in Kind by Category.....	184
CHAPTER FIFTEEN:	185
NON-COMMUNICABLE DISEASES	185
15.1 Introduction.....	185
15.2 Hypertension and Diabetes.....	185
15.3 Cancer	187
15.3.1 Awareness of Cervical Cancer.....	187
15.3.2 Testing for Cervical Cancer	187
15.3.3 Breast Cancer	188
15.3.3.1 Breast Self-examination	188
15.3.3.2 Examination by Health Professional to Detect Breast Cancer.....	189
15.4 Injury.....	189
15.4.1 Road Traffic Accident.....	190
15.4.2 Accident not Related to Road Traffic Accident	190
15.4.3 Causes of Injury	192
15.5 Risk Factors.....	193
15.5.1 Alcohol Consumption	193
15.5.2 Smoking	194
15.5.3 The Use of Other Types of Tobacco	195
15.6 Physical Exercise	195
15.7 Health Insurance	197
ANNEX A1: SAMPLING AND WEIGHTING	200
Stratification of the Sampling Frame for the 2019/20 HBS	202
Requirements for the Sample Size.....	202
Sample Size Calculation.....	202
Sample Size and Allocation.....	202
First Stage Selection of Sample EAs	204
Second Stage Selection of Sample households	204
Effects of an Increase in the Number of Districts.....	204
Non-Response	204
Weighting Procedures	204
Weighting to Account for Non-response.....	205
Final Population Derived from the Weights.....	206

Annex A3: Creating the Consumption Aggregate and Estimating the Poverty Lines.....	206
A3.1. Calculating the Consumption Aggregate.....	206
A3.2 Food Consumption	207
A3.3 Non-food Consumption	207
A3.4: Exclusions from the Consumption Aggregate.....	208
A3.5: Normalising Consumption for Differences in Household Composition.....	208
A3.6: Normalising consumption for number of days in the household during last 14 days	209
A3.7: Normalising Consumption for Differences in Cost of Living	209
A3.8: Setting the Poverty Lines.....	210
A3.9: Poverty Measures	213
A3.10 Replicating the Results	213
ANNEX B: ADDITIONAL TABLES BY CHAPTER.....	215
ANNEX C: Confidence Intervals for Basic Needs and Food Poverty Headcount Rates	238
Annex D	239
Annex E Questionnaire.....	255
Annex J: List of Contributors	331

EXECUTIVE SUMMARY

Results of Poverty using a Welfare Measure:

- **Basic needs poverty and extreme poverty have declined since 2009/10.** Basic needs poverty declined from 34.9 percent to 25.7 percent between 2009/10 and 2019/20, and food poverty (extreme poverty) declined from 11.7 percent to 9.3 percent within the same period. These figures come from the HBS consumption-based headcount index, which measures the proportion of the Zanzibar's population with a consumption level below the poverty line that could not meet their basic consumption needs. About 9.3 percent of the population is extremely poor and cannot afford to buy basic foodstuffs to meet their minimum nutritional requirements of 2,200 kilocalories (Kcal) per day. These poverty figures are estimated using respectively, the national basic needs poverty line of TZS 66,313 per adult per month and the national food poverty line of TZS 47,541 per adult per month.
- **The depth of poverty also declined.** Depth captures the gap between households' consumption level and the poverty line where the non-poor households' depth is zero. It declined by 2.4 percentage points between 2009/10 and 2019/20. Within the same period, both the rural and the urban basic needs poverty gap declined by over 2 percentage points. Additionally, there was a decline in the share of the population living in poverty in Zanzibar over the last decade, relative to the growth in the total population. This suggests that households were able to reduce their consumption shortfall by a notable margin relative to the poverty line. The observed consumption gap of the poor implies that the decline in the poverty index is explained by an increase in the number of non-poor people.
- **Majority of the poor and non-poor are still clustered around the poverty line.** Around 417,256 Zanzibaris are still below the basic needs poverty line. While the basic needs poverty headcount declined by 9.2 percentage points over the past decade, the absolute number of poor people only declined by about 27,000 people due to population growth. The proportion of people along the food poverty line saw some notable reduction within the last five years (from 157,133 in 2014/15 to 150,840 in 2019/20) but remained virtually the same over the last ten years. The food poverty headcount rate fell by 2.4 percentage points from 11.7 percent in 2009/10 to 9.3 percent in 2019/20.
- **A large share of the population hovers around the poverty line, likely to escape poverty but also prone to fall into it.** Small changes in the national poverty line yield significant differences in estimated poverty levels, indicating a high concentration of individuals around the basic needs threshold. For example, an increase of the basic needs poverty line by 20 percent (TZS 13,263 per adult per month) leads to a change of poverty rate by 53.0 percent (the headcount rate increased from 25.7 percent to 39.3 percent). The significant number of people clustering around the poverty line suggests that an important proportion of moderately poor people are positioned to move out of poverty, but also that an important proportion of non-poor people are vulnerable to falling into poverty.
- **Poor households are larger in size and have more dependents than non-poor households.** The interaction between family size and poverty is bidirectional. A high number of children and dependents affect the ability of the poor to cover their basic food needs and to move out of poverty. On the other hand, poor households tend to have more children to compensate for their inability to rise from poverty by investing in the human capital of their children and having many as an insurance strategy against infant mortality, trapping them in a vicious cycle of poverty.
- Almost three-quarter (73.3 percent) of the basic needs poor and 76.5 percent of the food poor in Zanzibar live in rural areas. **Poverty is particularly pervasive in rural areas**, where the majority (55.8 percent) of the Zanzibar population resides. About 305,648 people in rural areas live in basic

needs poverty and 114,439 live in food poverty, compared to 111,608 living in basic needs poverty and 35,401 in food poverty in urban areas.

- **Poverty is negatively correlated with higher levels of education of the head of household.** Higher education levels of the household head, particularly secondary and upper education, seem to be associated with better income-generating opportunities and significantly tend to lower poverty levels. Education positively affects the living standards and poverty reduction, either directly or indirectly through its impact on health gains, productivity, social integration and so forth.
- **Running a non-farm business is associated with lower poverty.** The 2014/15 and 2019/20 HBS asked detailed questions about non-agricultural businesses the households were running. Households with a non-agricultural business have lower levels of poverty, suggesting that the development of non-farm employment can offer a pathway out of poverty. However, the results show that being employed is not a guarantee of not being poor. From the 2019/20 HBS, households with four or more employed members have a high basic needs poverty headcount rate (36.5 percent) compared to households with fewer members employed. Large family sizes and low wages of those in employment could explain this observation. The working poor is earning low wages which are not high enough to lift them above the poverty line. Increasing welfare state provision, increasing minimum wages and absorbing educational and health care costs are methods to potentially reduce the proportion of the working poor.
- **Working in agriculture does not impact the incidence of being poor or non-poor.** From the 2019/20 HBS, the headcount poverty rate was higher among households that engaged in agricultural activities (30.7 percent) compared to households that did not (22.8 percent). For urban households that did not engage in agricultural activities, the poverty headcount rate was higher (16.5 percent) and for rural households that did not engage in agricultural activities, the poverty rate was lower (31.2 percent). Moreover, the majority (56.3 percent) of the poor population were not using agricultural land.
- **Consumption inequality remains stable and moderate.** The Gini Coefficient measures income inequality or consumption expenditures across a nation's population based on consumption per capita. For the past decade, Zanzibar experienced a marginal increase in consumption inequality by 1.0 percentage point from 30.0 percent in 2009/10 to 31.0 percent in 2019/20. Zanzibar's inequality level is moderate and compares favourably with sub-Saharan Africa (an average of 45.1).
- **The picture of overall food security is mixed.** The proportion of households that consume three or more meals in a day has increased by 10 percentage points over the past decade, leading to about nine out of ten households falling within an acceptable food security score from the 2019/20 HBS. The average food security scores for Kaskazini A and Kaskazini B seem to be similar to the other districts in Pemba, except Micheweni which had the lowest food security score among all the districts of Zanzibar.

Results of Poverty using Non-welfare Measures:

- **Considerable improvements have been made regarding the standard of housing.** Majority of houses were built by using modern materials, especially in the urban areas. The proportion of households connected to electricity has increased to 57.6 percent in 2019/20 from 25.2 percent in 2004/05. Access to an improved water source stood at 93.1 percent which is a considerable increase compared to previous surveys. The proportion of households using flush toilets increased to 51.8 percent in 2019/20 from 19.6 percent in 2009/10 while the proportion of households with no toilet decreased to 11.5 percent from 20.3 percent within the same timeframe. However, there is still a big rural/urban and Unguja/Pemba disparity in these indicators.
- **The situation in the education sector is a positive one.** Adult literacy rates continue to increase steadily over the last decade. The attendance of 6 to 13 years old children at school has risen by ten

percentage points in the last 10 years. In 2019/20, basic and primary net and gross enrolment rates have largely increased compared to the previous surveys, except the net enrolment rate for primary education which remains virtually the same over the past decade.

- Overall, in the **health sector**, there have been notable improvements, most remarkably in the **reduction of the incidence of malaria** across all ages. The percentage of households living less than two kilometres from a health centre has steadily increased over the last decade. The percentage of people who paid for consultation or advice has increased greatly from 14.4 percent in 2009/10 to 19.1 percent in 2019/20. Encouragingly, 8.6 percent of respondents in 2014/15 did not seek medical help as it was too expensive but that declined massively to 1.6 percent in 2019/20. Generally, there appears to have been encouraging developments within the health sector.

Other Chapters within HBS

- **Demographically, the HBS 2019/20 shows some similarities with the previous HBS but with some exceptions.** Even though the proportion of the population aged 18 years or below with a birth certificate has declined from 86.7 percent in 2014/15 to 81.2 percent in 2019/20, birth notification has increased by about 7 percentage points within the same period. Average household size has also declined but with a small difference between urban and rural areas. Furthermore, the dependency ratio has declined from 86 percent in 2014/15 to 83 percent in 2019/20, suggesting the continued reduction in the fertility rate. Over one out of five of all households (22.8 percent) are headed by a woman, with no considerable change over time. About five percent of children have been orphaned, with a similar percentage noted in the previous HBS.
- **About three-quarter of the working-age population is in the labour (74.6 percent), with most of the inactive population being full-time students.** Most employed people are subsistence farmers, fishers or hunters (29.0 percent), followed closely by those engaged in elementary occupations (22.7 percent), service and shop sales workers (21.4 percent), with a little over one in ten of the employed engaged as craft and related workers (13.4 percent). The remaining employed people are engaged as technicians and associate professionals (5.4 percent), professionals (2.9 percent), clerks (2.1 percent), plant and machine operators and assemblers (2 percent), with legislators, administrators and managers constituting 1.2 percent.
- Of the rural population aged 15 years and above, almost one out of ten classify themselves as unemployed (9.8 percent) **while in urban areas, around 17 percent are unemployed.** There are distinct age differences. In rural areas, for instance, 16.2 percent of young people (aged 15 to 24 years) are unemployed and in urban areas, it rises to almost one-quarter (24 percent). The data shows that as people get older, the tendency to call themselves unemployed decreases. The proportion of females who classified themselves as unemployed was almost twice the proportion of unemployed males in all the age ranges.
- **About 99 percent of all households live within a distance of 1 km to drinking water in the dry season**, with no marked difference between the rural and urban areas. Furthermore, around ninety out of hundred households (91.1 percent) have access to improved sources of drinking water. The access to improved sources of drinking water for households residing in the rural areas has marginally improved over the past decade. More females are involved in collecting water during the dry season than men across all the age groups, with an average of 2.2 trips made per day to collect water during the dry season in Zanzibar.

- **Close to half of all households in Zanzibar run a business (48.9 percent)**, with 54.6 percent of households in the urban areas and 47.6 percent in the rural areas running a business from the
- 2019/20 HBS. Majority of households run only one business (67.4 percent); with just about a quarter of households running two or more businesses. Around one-third (33.1 percent) of household businesses in Zanzibar operate in a dedicated space and 12 percent in a permanent building other than the respondent's home. Nearly all businesses have sole owners (97.1 percent) but a small proportion of businesses have a partnership (2.5 percent).
- Close to two-thirds of the households (64.2 percent) stated that their own savings were the main source of business capital, *with close to one out of five households (18.1 percent) stating that they used a gift from family as capital for their businesses*. Just over a quarter of businesses in Zanzibar are registered (27.6 percent), with the remaining 72.4 percent of businesses not registered. Only about one out of every ten businesses in Zanzibar (9.6 percent) pay income tax, **with a whopping 81.2 percent of businesses not paying any form of tax**. Rural and urban differences are marginal in terms of registration and taxpaying.
- Overall, close to half of all households in Zanzibar (47.4 percent) in 2019/20 HBS **made at least one overnight trip in the last 12 months**. About 68.2 percent of households made trips within Zanzibar, followed by 29.7 percent of the trips made within the Tanzania Mainland, with just about 2 percent of the trips made overseas. Among the trips that were taken by households to five top regions in Tanzania Mainland, the Dar es Salaam Region had the highest proportion of trips (63.1 percent), followed by Tanga (17.4), Morogoro (4.5 percent), while only a few (2.2 percent) of the trips were taken to Pwani and Arusha Region each. The main purpose for recent trips was to visit friends (62.3 percent), holiday (6.1 percent), with business purposes constituting about 3 percent. The main means of transport used to make the most recent trip was ferry or boat (54.3 percent), followed by a bus (37.9 percent), aeroplane (3.7 percent) and, finally, own car (1.9 percent). In terms of the type of place respondents stayed for the trip, by far, the majority (90.6 percent) stayed in private homes and less than one percent stayed in hotels.

Table 00: 1 Summary of Key Indicators by Area, 2014/15 and 2019/20 HBSs

Indicator	2014/15			2019/20		
	Rural	Urban	Total	Rural	Urban	Total
Household Demographic Characteristics and Housing						
Average household size	5.5	5.6	5.6	5.4	5.4	5.4
Proportion of Dependants	49.4	41.9	46	49.1	40.8	45.4
Percentage of female-headed households	22.5	23.3	22.8	22.6	25.2	23.7

Mean Households Food Consumption Score for Acceptable Consumption				54.4	45.6	63.0
Gender						
Percentage of children age 5 participated in one year before the official primary entry age				73.8	88.7	80.2
Proportion of Population who Used Computer or Tablet				5.0	17.2	10.6
Proportion of Population who Used Internet Over the Past 3 Months before the survey				9.6	25.4	16.8
Proportion of Household who Owned Dwelling				2.8	4.4	3.4
Proportion of Population who Secured Right to Agricultural Land				8.3	9.3	8.5
Proportion of Persons who Make Final Decision on Spending Agricultural Income				19.9	21.4	20.1
Non-Communicable Diseases						
Percentage Distribution of Population aged 25 - 49 Affected by Hypertension				9.3	16.4	12.7
Percentage Distribution of all Population Affected by Diabetes				1.0	1.8	1.3
Proportions of Women aged 10 - 49 who Heard Cervical Cancer				39.6	60.4	43.1
Proportions of Women aged 20 - 49 who Tested for Cervical Cancer				5.9	11.0	8.9
Proportions of Women aged 20 - 49 Who Self-check their Breasts to Detect Breast Cancer				7.3	9.7	8.5
Proportions of Women aged 20 - 49 Who Underwent Examination to Detect Breast Cancer				23.4	38	31.4
Percentage of Population who Reported Road traffic accident Injury in the Past Two Week				1.9	2	1.9
Percentage of Population who Reported Accident not related road traffic Injury in the Past Two Week				5.6	4.6	5.2
Percentage of Population Aged 20 and above Who Drink Alcohol				0.6	1.0	0.8
Percentage of Population Aged 5 and Above who Smoke Cigarettes				1.8	1.8	1.8
Percentage of Population Aged 5 and Above who are Currently Smoke or use any Type of Tobacco				0.8	0.2	0.5
Percentage Distribution of Population Aged 5 and Above by their Participation in any Physical Exercise for at Least 10 Minutes				12.0	18.0	14.7
Percentage Distribution of the Population Who Had Health Insurance				1.7	6.1	3.7

* The implementation of Education policy of 2006 in 2016 has been affect the education system from 7 years at primary schools at Aged 7 to 6 years at aged 6.

New structure of the Formal Education system shall be 2-6-4-2-3+ (that is 2 years of pre-primary education, 6 years of primary education, 4 years of secondary education ordinary level, 2 years of secondary education advanced level and a minimum of 3 years of higher education)

CHAPTER ONE INTRODUCTION

1.0 Overview

The Office of the Chief Government Statistician Zanzibar (OCGS) has been conducting the Household Budget Surveys (HBS) since 1992 to collect data on consumption, expenditure, poverty and other socio-economic indicators for Zanzibar. The first HBS was conducted in 1992 that provided key socioeconomic indicators at the national and subnational levels of Zanzibar. Since then, the OCGS has successfully completed four more rounds of the HBS. The 2019/20 HBS provides empirical data for informed policy and decision-making, planning, monitoring and evaluation at the global, national and district levels of Zanzibar.

The Office of the Chief Government Statistician (OCGS) Zanzibar, as the sole provider of official statistics has, among others, the responsibility of undertaking National Statistical Surveys (NSS). To this end, the role of the OCGS is to provide up-to-date information for the assessment of the MKUZA and other national developmental initiatives. The OCGS has, therefore, undertaken the 2019/20 HBS to feed the need for information at the national level assessment of vision 2020, MKUZA, re-basing of National Accounts and global assessment through Sustainable Development Goals (SDGs).

In carrying out the 2019/20 HBS, the OCGS collaborated with Planning Commission under the Ministry of Finance and Planning Zanzibar. Other institutions included President's Office, Region Administration, Local Government and Special Department (PORALG); Local leaders "Shehas"; Bank of Tanzania (BOT); Ministry of Education, Science, Technology and Vocational Training (MoESTVT); Nutrition Department under the Ministry of Health; Food Security Department under the Ministry of Agriculture; World Bank (WB); UN Women; United Nations Development Program (UNDP); and United Nations Children's Fund (UNICEF). Technical assistance during the planning and implementation of the survey was provided by the World Bank and UNICEF. A large amount of funding (70 percent) of the 2019/20 HBS survey was provided by the Revolutionary Government of Zanzibar (RGoZ) and assisted by Development Partners (World Bank, UNDP, UNICEF, and UN Women).

1.1 Objective

The main objective of the 2019/20 HBS is to obtain updated information on poverty, consumption and other socio-economic indicators for Zanzibar. The 2019/20 HBS will be used for the monitoring and evaluation of the progress made towards poverty reduction and the efficiency of development policies, programs and projects geared towards improving households' living standards. Similarly, it will serve to evaluate the Development Vision 2020, MKUZA III and Global Agenda 2030 on Sustainable Development Goals (SDGs).

Specifically, the 2019/20 HBS aimed to;

- Review the consumption pattern of goods and services of Zanzibar households.
- To help in rebasing National Accounts statistics (GDP) and Consumer Price Index (CPI).
- To provide baseline data on other socio-economic indicators to generate a measure of multi-dimensional poverty.
- To provide information on the distribution of household income and expenditure.

1.2 Survey Implementation

The preparation of 2019/20 HBS began in January 2018 by establishing Technical committee (TC) which drew members from Ministries, Department and Agencies (MDAs) of the RGoZ and Development Partners (DPs). The TC was responsible for the provision of technical and financial support for the implementation of the survey.

1.2.1 Methodology

The 2019/20 HBS sample was designed to allow representation of the estimates at the national level, for urban and rural residence and for the 11 districts of Zanzibar as a lower domain, slightly more than the 2014/15 HBS which consisted of ten districts. A two-stage stratified sampling design was used. At the first stage, Enumeration Areas (EAs) created during 2012 Population Census enumeration were grouped by districts and by rural-urban location. The EAs were then drawn using Probability Proportional to Size (PPS) whereby the total number of households in each EA were used as a measure of size. At the second stage, private households (i.e. excluding institutional households such as military barracks, hostels e.tc) which were the ultimate sampling units were drawn using Systematic Random Sampling from the listed households which was done few days before selection took place.

A total of 235 EAs were selected from the 2012 Tanzania Population and Housing Census (TPHC) list of EAs (Zanzibar EAs) which constituted the Sampling Frame. The EAs were then grouped into 11 districts, taking into consideration the standard errors required for estimation of poverty indicators at district and rural-urban domains. Acceptable accuracies were deemed to be a coefficient of variation (CV) of less than 5% on the national poverty estimate and less than 20 percent on the district and urban/rural level poverty and consumption estimates.

1.2.2 Sample Size and Allocation

Sample size and allocations were created by iterating Excel Solver to minimize the total sample size under the coefficient of variation constraints and positivity constraints for each variable of interest. Once calculated, the largest sample size from each stratum was chosen which ensured minimum sample size requirements for every stratum for every variable. This led to a more efficient sample with 2,820 households required from within the 235 EAs. The details of the sample size used and its allocation are displayed in the Table 1.1.

Table 1. 1: Sample Allocation Proposal for HBS 2019/20

S/N	Domain	Clusters	HHs	Rural EAs	Urban EAs	Rural HHs	Urban HHs	HHs per Clusters	RSE
1	Kaskazini A	25	300	23	2	276	24	12	19.90%
2	Kaskazini B	19	228	18	1	216	12	12	19.90%
3	Kati	18	216	17	1	204	12	12	19.50%
4	Kusini	15	180	12	3	144	36	12	19.90%
5	Magharibi A	36	432	12	24	144	288	12	19.90%
6	Magharibi B	39	468	11	28	132	336	12	19.80%
7	Mjini	29	348	*N/A	29	*N/A	348	12	19.20%
8	Wete	16	192	12	4	144	48	12	13.30%
9	Chake	13	156	10	3	120	36	12	14.00%
10	Micheweni	11	132	10	1	120	12	12	10.30%
11	Mkoani	14	168	12	2	144	24	12	13.30%
	National	235	2,820	137	98	1,644	1,176	12	4.90%

*Note: Not applicable for Mjini district, it is a pure urban settlement

1.3 Improvement

There were many improvements in the survey methodology during the implementation of the 2019/20 HBS as compared to the 2014/15 HBS. These included:

1.3.1 Methodology changes

- (i) Administered 14-day diary instead of a 28-day diary.
- (ii) More disaggregated COICOP coding for food items

- (iii) Use of Tablet - Computer Assisted Personal Interviews (CAPI) for data collection instead of Paper Assisted Personal Interviews (PAPI).

1.3.2 Additional Modules and Questions

- (i) Time use (TUS) for profiling gender related indicators,
- (ii) Labour force module,
- (iii) Non-communicable diseases (NCD) module,
- (iv) Transfer goods and services in and out of Zanzibar,
- (v) Additional questions for the Food Security module,
- (vi) Nutrition for children under five years,
- (vii) Social protections module and
- (viii) Under-five mortality.

1.4 Questionnaire

The 2019/20 HBS was implemented using seven electronic questionnaires to collect data throughout the year, while one paper questionnaire (Form VI) for the individual members of the household was used to record their daily expenditure for goods and services to assess the seasonal variations in consumption and expenditure of the households. The questionnaires were used to capture information reflecting comprehensive coverage of the living conditions (engagement on economic activities, employment, household possessions, expenditure and income, 'day-to-day consumption and expenditure', etc.), services (transport and communication, etc.), health related issues (with module on non-communicable diseases), issues related to remittance (domestic and abroad), as well as, assessing time use for gender profiling.

The questionnaires were set in forms and each form carries different modules reflecting contents. The forms used were:

1. Form I: Demographics, parents' survivorship, citizenship, education and literacy, health, labour market indicators, non-farm household businesses, individual non-wage income migration, birth delivery and breast feeding, non-communicable diseases (NCDs), disability and nutrition for children under the age of five.
2. Form II: Dwellings; utility; water and sanitation, transport and communications, recall expenditures for main dwelling, durable goods, furniture, furnishings, tools and appliances for household maintenance, garments and footwear, health expenditures, transport and communication, vehicles purchased, transportation, entertainment facilities, expenditures to buy or rent any of the specified equipment, expenditures on personal trips abroad.
3. Form III: Businesses and individual income; non-farm household businesses and investment in last 12 months.
4. Form IV: Agriculture and livestock, livestock by products, food security, food consumed, non-wage, social security, access to community resources and crops grown by households.
5. Form V: Household diary for recording daily household consumption and expenditure over a 14-day period.
6. Form VI: Individual diary for recording daily consumption and expenditure for each household member aged five and above for 14 days.
7. Form VII: Time use.
8. Form VIII: Transfer to and from Zanzibar, demographic characteristics of sender, frequency and value of cash received, usage of cash received, items in kind received and household expenditure on outward personal transfers.

1.5 Pre-test and Pilot

1.5.1 Pre-test

The data collection tools were pretested to ensure that the pattern of the questions was not confusing and could be well-understood by the respondents. This was done by an experienced HBS team member and field workers who were recruited and trained on how to administer the questionnaires.

1.5.2 Pilot

The reviewing of questionnaires was conducted on non-pre-selected areas with both urban and rural settlements in Unguja and Pemba. The pilot was undertaken over a 14-day period to reflect the data collection process. All observations were then discussed and incorporated in the tools before the main training took place.

1.6 Listing, Recruitment and Training

Listing of households was conducted in all 235 clusters (Enumeration Areas) in December, 2018. The listing exercise was conducted Survey Solution Programme followed by a systematic selection (Excel) of household involved in the survey. A total of 142 interviewers were recruited from the 11 districts to conduct interviews from the selected households. Training of Trainers (ToT) took place in Pemba at the end of January, 2019. Training of field staff (interviewers, supervisors, quality assurance staff and editors) was conducted at Unguja and Pemba for 21 days from 6th to 26th February 2019.

1.7 Data collection

Data collection took place over 12 consecutive months starting from 1st March 2019 to 28th February 2020. This exercise was conducted using tablets (CAPI) with internet connectivity for a timely transmission of data to the OCGS headquarters.

1.7.1 Data Management

Data collection, editing and processing were done concurrently. The Survey Solutions software combined the interviewing component with a powerful survey management system. All consistency checks were run in the field while the interviews were taking place.

1.7.2 Response Rate

Out of 2,820 selected households, 2,804 households participated in the survey, yielding a response rate of 99.4 percent.

1.8 Concepts and Definitions

In this section the frequently used concepts and definitions used to interpret and analyse the 2009/10, 2014/15 & 2019/20 HBS results are described.

Household: People who live together and share income and food.

- A household may be one-person or multi-person-household. A one-person household is a person who lives alone in whole or part of a housing unit and has independent consumption. Multi-person household is a group of two or more persons who occupy the whole or part of a housing unit and share their consumption. Usual households of this type contain husband, wife and children. Other relatives, boarders, visitors and their persons are included as members of the household if they pool their resources, share their consumption and have been living with the household for at least two weeks.
- Household servants are members of the household only if they are taking their meals in that household and recognize the Head of Household as their head.

- Children who are at boarding school are included as household members.
- A household with more than five lodgers is regarded as a Guest House and is excluded.
- A husband with more than one wife who spends his time in more than one household is counted as a household member if he spends at least half of his time in that household.

Head of Household: A member of the household who holds the role of decision maker in that household. Other residents normally recognize this individual as their head. In most cases the Head of Household takes part in the economy, control and welfare of the household.

Household size: The number of persons who usually live in the household including boarder and servants etc.

Last 7 days: For questions that ask for information for “last 7 days” refer to the immediate last 7 days. For example, if the interview is on Tuesday “last 7 days” refers to the previous Tuesday through to Monday.

Last 12 months: This is the previous 12 months starting from date before the date of first visit of interview took place.

Marital Status: This is the current status at the time of the survey.

Single: A person living alone or children.

Married: Two people, male and female married by means of traditionally, Government or Religious. Includes men and women who have decided to live together as husband and wife or they often meet sexually (living together).

Divorced Persons: are those persons who were once married but their marriages were permanently terminated and have not remarried. Note that in polygamous marriages the divorce of one or more wives does not categorize the husband as divorced if he still lives with the other wife (wives).

Separated: Either obtained a judicial or legal separation in a court of law or voluntarily separated without obtaining a court order.

Widowed: If spouse died and the person did not remarry again.

Dependency ratio: The dependency ratio is defined as follows:

$$\text{Dependency ratio} = \frac{\text{People aged less than 15 and above 64 years}}{\text{People aged 15 to 64 years}} \times 100$$

Food Share: The food share is defined as follows:

$$\text{Food share} = \frac{\text{Food consumption}}{\text{Total Consumption (Food + Non-Food)}} \times 100$$

Poverty: Measuring Poverty in the HBS uses consumption as the key welfare measure to analyse poverty. A consumption aggregate is created which comprises:

- food consumption, including food produced by households themselves
- expenditure on a range of non-food goods and services (e.g., clothing, utilities, transportation, communication, health, education, etc.).

The consumption aggregate does not include rent or other housing-related expenditures, nor does it include expenditures on larger consumer durable items (such as cars, TVs, computers, etc.).

The HBS 2014/15 collects consumption data at the level of households. For the purpose of poverty and welfare analysis total household consumption needs to be adjusted for differences in household size and composition. This is to account for the fact that, for instance, a single-person household requires less consumption than a family of five. The widespread approach in Sub-Saharan Africa, where typically a large share of consumption is spent on food items, is to compute consumption per adult equivalent. This requires equivalence scales to convert household members of different age and sex into a standardized adult based on assumptions about caloric requirements. The HBS 2014/15 poverty analysis follows in this tradition and uses consumption per

adult equivalent as the key welfare measure. Price deflators are used to adjust consumption per adult equivalent for differences in prices across regions and over the course of HBS fieldwork.

The poverty lines are based on the cost-of-basic-needs approach. The HBS 2014/15 food poverty line (TZS38,071 per adult per month) is based on the cost of a food basket that delivers 2,200 calories per adult per day (given consumption patterns in a reference population). The basic needs poverty line (TZS 53,377 per adult per month) adds an allowance for basic non-food necessities to the food poverty line.

The basic needs headcount poverty rate (or as used in the text, poverty rate) measures the proportion of the population whose monthly (price-adjusted) total household consumption per adult equivalent is below the basic needs poverty line, and the extreme headcount poverty rate (used in the text as extreme poverty rate) measures the proportion of the population whose monthly (price-adjusted) total household consumption per adult equivalent is below the food poverty line.

Poverty Gap Index (PGI): A measure of the depth/intensity of poverty. Poverty gap index (PGI) is calculated as:

$$PGI = \frac{1}{N} \sum_{i=1}^n \left(\frac{z - y_i}{Z} \right)$$

Where: N is the total population, n is the total population of poor who are living at or below the poverty line, z is the poverty line, and y_i is the consumption of the poor individual.

Gini Co-efficient: Is a measure of inequality among the population. It refers to the extent to which income is distributed in an uneven manner among the population and ranges from 0 (every person has the same consumption) to 1 (one person has all of the consumption in the country). It is defined as the ratio between the area demarcated by the diagonal and the Lorenz curve and the triangular region underneath the diagonal of the Lorenz plot.

The Percentile Ratio is a ratio of consumption of the richest 90 percent to consumption of the poorest 10 percent.

**CHAPTER TWO:
HOUSEHOLD DEMOGRAPHIC COMPOSITION**

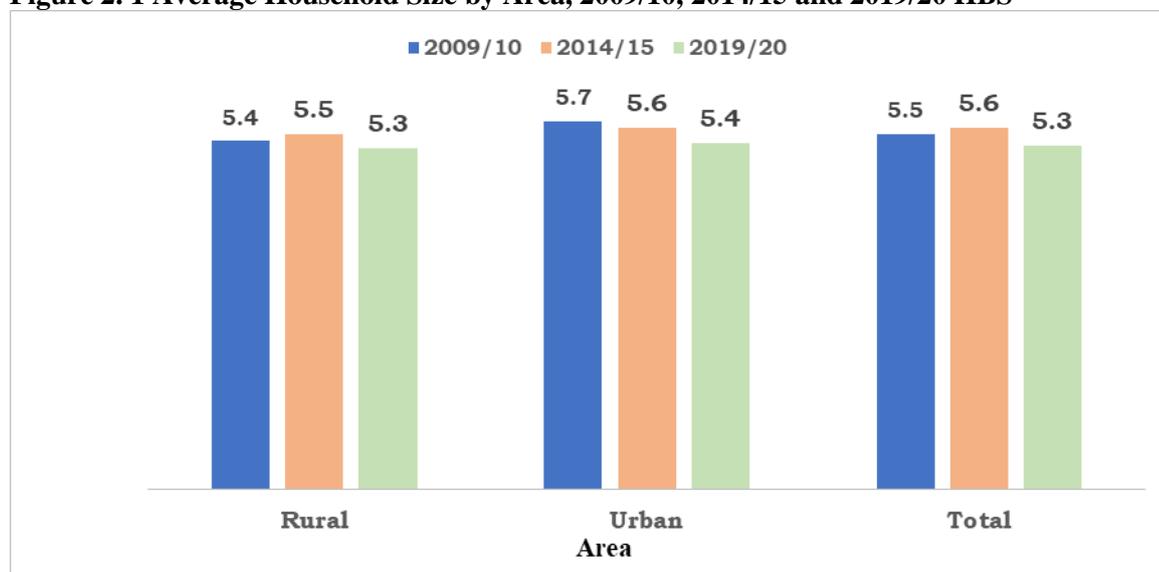

2.1 Introduction

This chapter provides a descriptive summary of the demographic structure of households, which includes the distribution of household members and their composition by sex, age and marital status. The chapter also discusses the status of heads of households by gender, educational attainment and occupation, as well as, orphan hood and status of birth registration.

2.2 Household Composition and Household Size

Average household size is obtained by dividing the total number of persons living in private households by the total number of private households. The result from the 2019/20 HBS reveals that the average household size in Zanzibar was 5.3 members. The urban areas have a larger average household size (5.4) than the rural areas (5.3). There is a slight decline in average household size from 5.6 in 2014/15 HBS to 5.3 in 2019/20 HBS. The trend in urban areas shows that there is a decline in size of household from 5.7 in 2009/10 HBS to 5.4 in 2019/20 HBS (Figure 2.1).

Figure 2. 1 Average Household Size by Area, 2009/10, 2014/15 and 2019/20 HBS

Household size varies across districts, with the result showing that Pemba districts have larger household size than Unguja districts. Specifically, from the 2019/20 HBS, Chake Chake district has the largest average household size (6.5) while Kusini district has the smallest household size (4.1) as shown in Figure 2.2. A similar trend was observed from both the 2009/10 HBS and 2014/15 HBS (Tables 2.1).

Figure 2. 2 Average Household Size by District, 2019/20 HBS

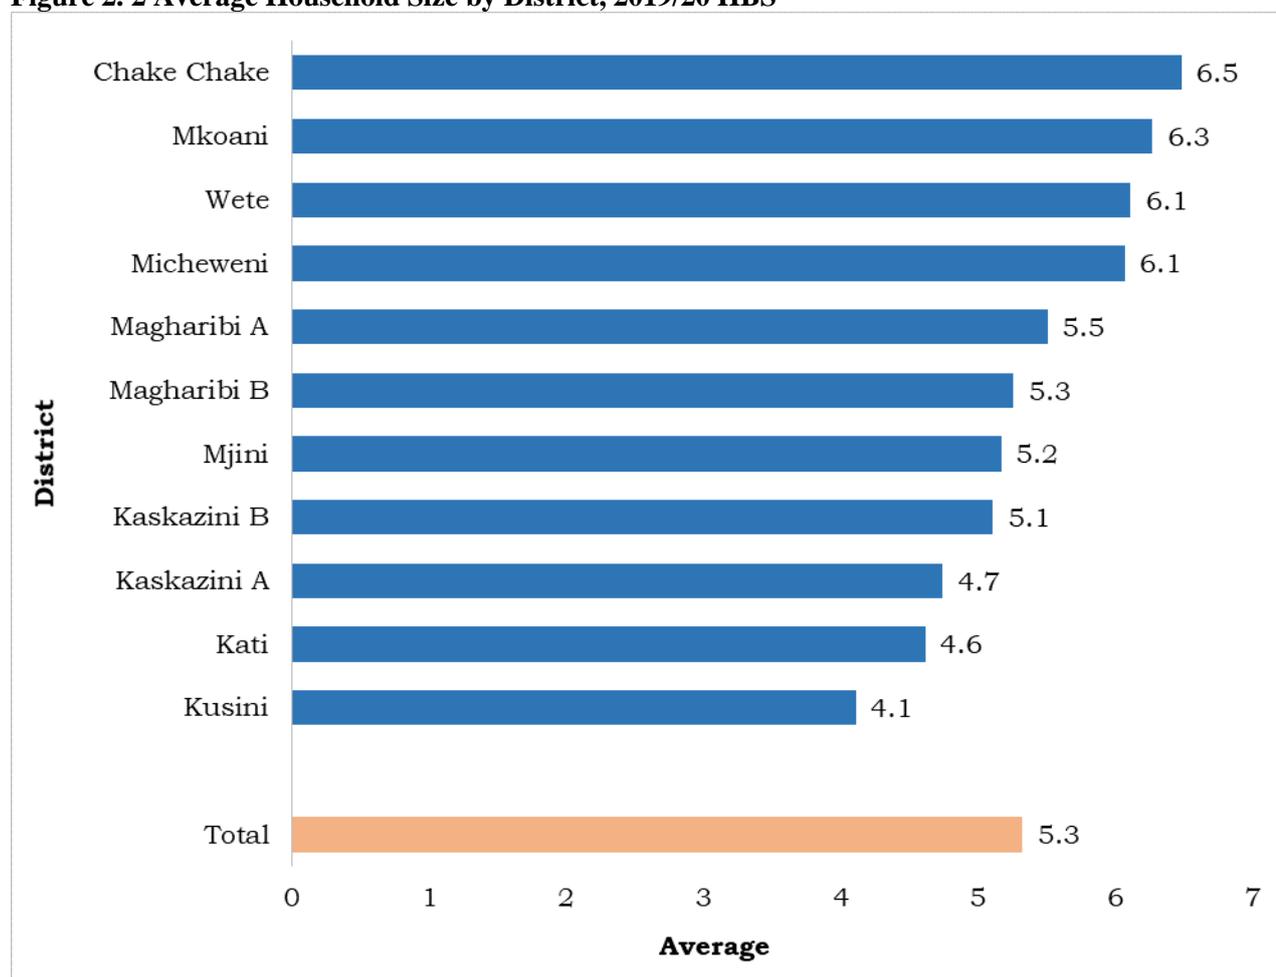

Table 2. 2: Average Household Size by District, 2009/10, 2014/15 and 2019/20 HBS

District	2009/10	2014/15	2019/2020
Kaskazini A	5.1	5.1	4.7
Kaskazini B	4.6	4.8	5.1
Kati	4.8	5.0	4.6
Kusini	4.1	4.5	4.1
Mjini	5.3	5.6	5.2
Magharibi A	5.9	5.6	5.5
Magharibi B	-	-	5.3
Wete	5.9	5.7	6.1
Micheweni	5.8	6.2	6.1
Chake Chake	6.2	6.3	6.5
Mkoani	5.7	6.2	6.3
Total	5.5	5.6	5.3

2.2.1 Population Size

According to the 2019/20 HBS results displayed in Figure 2.3b, the estimated population for Zanzibar is 1.62 million. The population distribution is slightly higher in rural areas (0.907 million; 55.8 percent) than in urban areas (0.718 million, 44.2 percent). This pattern is similar from both the 2009/10 HBS and 2014/15 HBS.

The Population Pyramid in Figure 2.3a reveals a youthful population structure for Zanzibar as there is an inverse relationship between age and population size for both males and females. For instance; over four out of ten people (42.0 percent) in Zanzibar are children under the age of 15 while as little as 3.3 percent of the population belong to the 65+ age group. The population structure depicts a relatively high dependency ratio of 83 percent where each active person has to provide for themselves and several dependants.

Figure 2. 3a Population Pyramid for Zanzibar, 2019/20 HBS

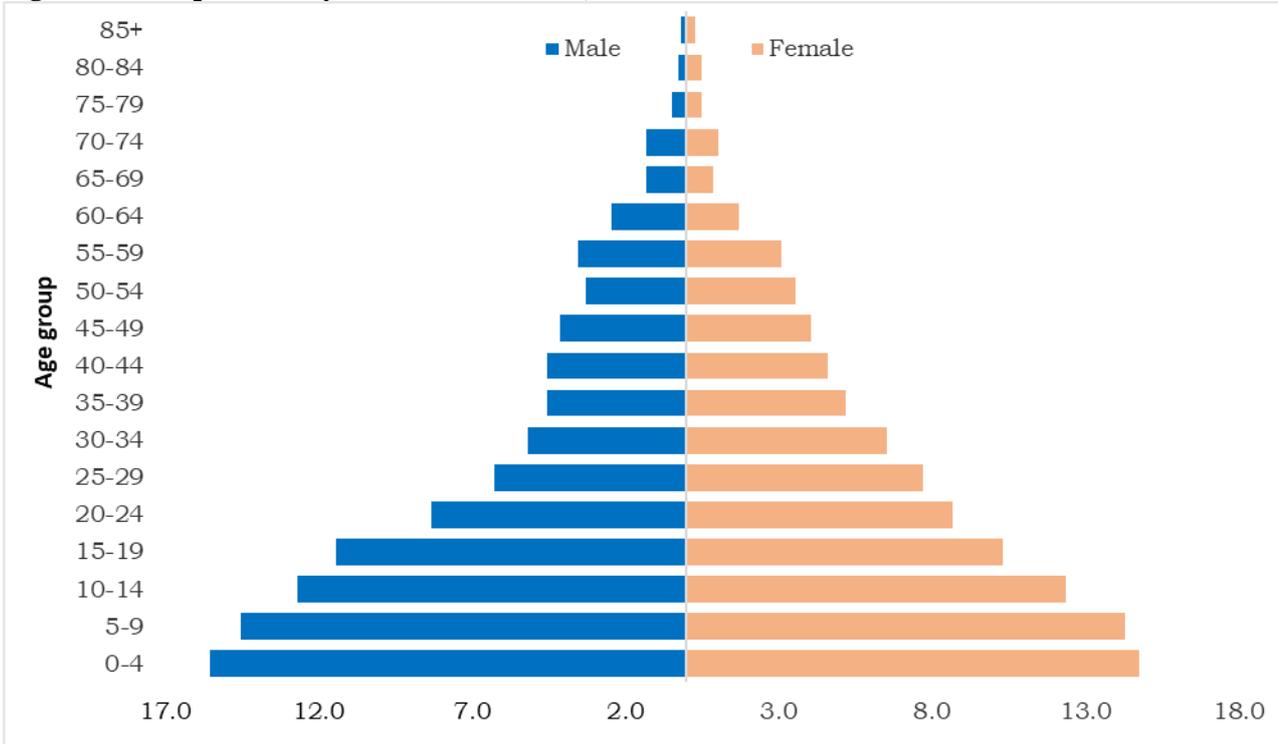

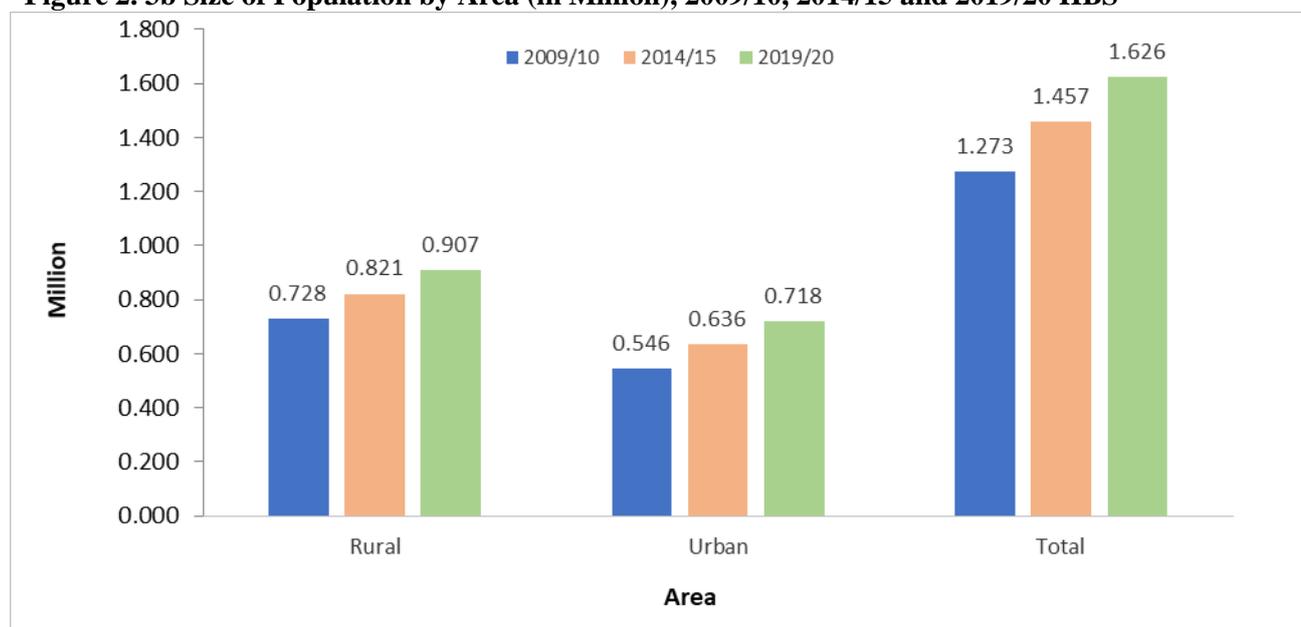

Figure 2. 3b Size of Population by Area (in Million), 2009/10, 2014/15 and 2019/20 HBS

Moreover, in Table 2.2, the largest population age group is 0-4 years which constitutes 15.1 percent while less than one percent of the population is in age group of 75-79 years. A similar pattern is observed in rural and urban areas, as well as, from the previous surveys. The results also show that population increased from 1.27 million in 2009/10 HBS to 1.62 million in 2019/20 HBS.

Table 2.3: Percentage of Population and Five-Year Age Groups by Area, 2009/10, 2014/15 and 2019/20 HBS

Year	2009/10			2014/15			2019/20		
	Rural	Urban	Total	Rural	Urban	Total	Rural	Urban	Total
0-4	17.8	13.4	15.9	18	14.8	16.6	17.3	12.4	15.1
5-9	14.3	12.4	13.5	15.2	12.2	13.9	15.5	13	14.4
10-14	13.8	13.7	13.7	12.9	12.2	12.6	13	12	12.5
15-19	11.6	12.2	11.9	10.6	11.6	11	10.2	11.7	10.8
20-24	7.1	9.1	8	7.5	9.8	8.5	7.7	9.4	8.5
25-29	6.3	7.1	6.7	6.6	7.6	7	6.4	7.8	7.0
30-34	5.1	6.3	5.6	5.2	6.1	5.6	5.6	6.2	5.9
35-39	5.2	6.1	5.6	5.0	6.2	5.5	4.6	5.2	4.9
40-44	4.5	4.9	4.7	4.4	5.2	4.8	4.5	4.7	4.6
45-49	4.6	4.7	4.6	3.7	4.3	3.9	3.9	4.4	4.1
50-54	3.1	3.2	3.1	3.9	3.4	3.7	3.2	3.7	3.4
55-59	1.8	2.8	2.2	2	2.3	2.1	3.0	3.7	3.3
60-64	1.8	1.6	1.7	1.7	1.7	1.7	1.8	2.3	2.1
65-69	1.0	0.9	1.0	1.1	1.1	1.1	1.0	1.2	1.1
70-74	1.0	0.9	0.9	1.1	0.8	0.9	1.2	1.1	1.2
75-79	0.5	0.3	0.4	0.4	0.4	0.4	0.5	0.4	0.5
80+	0.6	0.5	0.5	0.6	0.4	0.5	0.6	0.7	0.6
Total %	100	100	100	100	100	100	100	100	100
Total Population	727,594	545,729	1,273,323	821,202	635,823	1,457,025	907,234	718,355	1,625,589

The composition population for females is slightly higher (51.4 percent) than males (48.6 percent). Females have higher Working Age Population (15 to 64) distribution (28.5 percent) than males (26.1 percent). There is almost equal population distribution in old age groups (65+) for both males and females. This pattern is similar from both the 2009/10 and 2014/15 HBSs.

2.2.2 Sex ratio

The overall sex ratio for 2019/20 HBS is 95, which indicates an excess of female over male population. However, sex ratio at age group 65-69 is 146 indicating a higher number of males than females in that particular age group.

Table 2. 4 : Percentage of Population and Five-Year Age Groups by Sex, 2009/10, 2014/15 and 2019/20 HBS

Age Group	2009/10			2014/15			2019/20			Sex Ratio
	Male	Female	Total	Male	Female	Total	Male	Female	Total

2.3 Dependency Ratio

Age-Dependency Ratio is the ratio of people under age 15 and age 65 and above (dependent) to those people of age 15-64 years (a.k.a. working age population). A ratio of one (1) or higher suggests that an individual in the society has to produce not only for themselves but also to cater for the needs of additional people (an economic burden). Economically, this implies a diversion of economic investment, where perhaps limited resources have to be dedicated to supporting expenditures on upbringing, health and education of dependents.

The HBS 2019/20 reveals that for every 100 persons in the economically active group (aged 15 to 64 years), there were 83 dependents. The dependency ratio is higher in rural areas (94) than in urban areas (70). At the national level, the dependency ratio decreased from 86 dependents in 2014/15 to 83 dependents in 2019/20 HBS. This pattern is similar for urban areas (Figure 2.4) while in the rural areas, there have been an increase in dependents (from 92 in 2009/10 to 94 in 2019/20).

Figure 2. 4 Age Dependency Ratio by Area, 2009/10, 2014/15 and 2019/20 HBS

The dependency ratio varies among district with the highest dependents in Mkoani District (124), followed by the other districts in Pemba whereas the lowest dependents were in Mjini District (62) in Unguja. This pattern has remained unchanged from the previous surveys (Table 2.5).

Table 2. 5: Age Dependency Ratio by District, 2009/10, 2014/15 and 2019/20 HBS

District	2009/10	2014/15	2019/20

Mkoani	103	106	124
Total	86	86	83

2.4 Marital Status

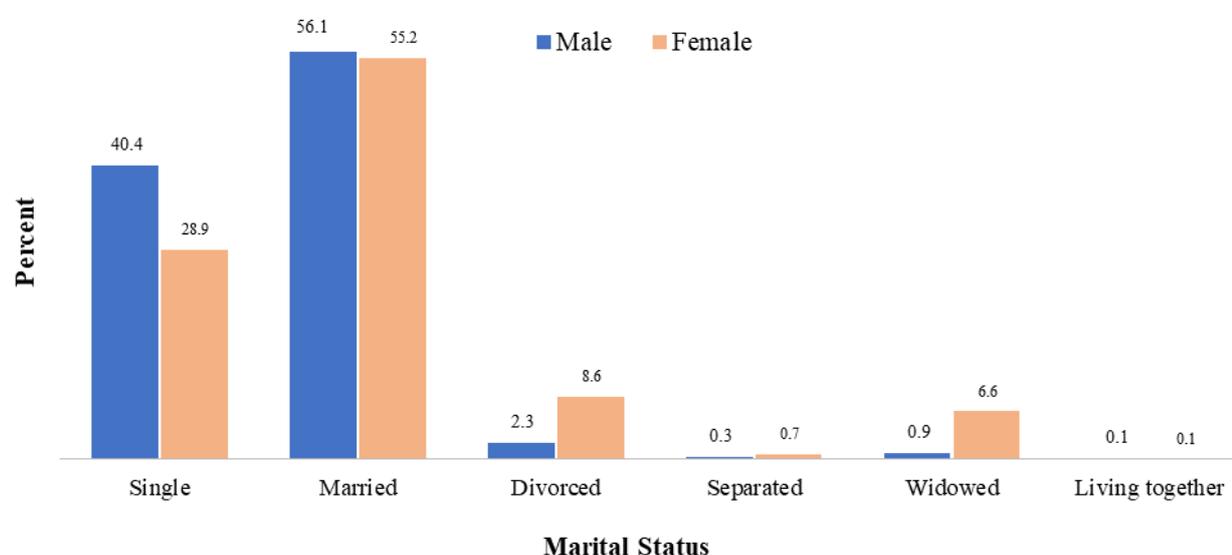

The result shows that 55.6 percent of the population above 15 years were married. The proportion of rural population that is married is higher (60.1 percent) than that of urban areas (50.7 percent). The proportion of the male population that is married is slightly higher (56.1 percent) than that of females (55.2 percent). Furthermore, less than one percent of both the male and female population were Living Together in Zanzibar (Table 2.6 and Figure 2.5).

In general, marriage remains the cultural norm and there have not been any major changes in the distribution of marital status over the last ten years (Table 2.6).

Figure 2. 5 Percentage of Population 15 Years and Above by Marital Status and Sex, 2019/20 HBS

At the district level, Kusini had the highest proportion of the population who are married (68.1 percent), followed by Kaskazini B (64.9 percent), while Mjini had the lowest (46.1 percent). The notable districts in

Zanzibar with the proportion of people living together are Mjini and Magharibi B with 0.3 percent and 0.2 percent respectively (Table 2.7).

2.5 Household Headship

The Head of Household (HoH) is the person who other people in the household recognise as the main decision maker in the household. The results show that over three-quarter (76.3 percent) of households are headed by males. There is no marked difference between male and female headed households in the urban and rural areas. This pattern is similar from both the 2009/10 and 2014/15 HBSs.

Table 2. 7: Percentage Distribution of Household Head by Sex and Area, 2009/10, 2014/15 and 2019/20 HBS

Sex of HoH Head	2009/10			2014/15			2019/20

At the district level, the Table 2.9 shows that the proportion of male headship is higher in relations to the female headship across all the districts of Zanzibar. Additionally, Kaskazini B district had the highest proportion of male-headed households (83.8 percent) while the proportion of female headed households was highest in Mjini district (29.6 percent).

Table 2. 8: Percentage Distribution of Head of Household by Sex and District, 2009/10, 2014/15 and 2019/20 HBS

There are considerable differences in educational attainment between the males and females in the rural and urban areas. In Table 2.11, it can be observed that the majority of heads of households attained Form 1-4 education level (40.5 percent). The proportion of heads of households with Form 1-4 educational attainment is higher in urban area (49.2 percent) than rural area (34.1 percent); and also higher for male-headed households (44.0 percent) than female-headed households (29.1 percent).

However, the results reveal that 17.2 percent of the heads of households have no education; and most of these groups are in the rural areas (23.9 percent). The proportion with no education was higher among the rural female-headed households (48.1 percent) than urban female-headed households (19.1 percent), and higher for rural males (16.9 percent) than urban male headed households (4.3 percent).

The results show that most of the household heads are employed as skilled agricultural or fishery workers (33.5 percent), with about five out of ten of these household heads located in the rural areas (49.7 percent) and just about 10 percent located in urban areas. In the urban areas, most of the heads of households were engaged as service workers and shop sales workers (29.8 percent), with more females engaged in this occupation (35.8 percent) than males (28.6 percent). The results further reveal that a small proportion of household heads (1.8 percent) are employed as legislators, administrators, and managers (Table 2.12).

2.6 Survival of Parents

The data on survival of parents are usually collected to determine the extent of orphan-hood in a society. Generally, the term ‘orphan’ means a person whose mother and father are both dead. However, the United Nations identifies an orphan as a person or child who has lost one or both of his parents. The age limit for somebody to be called an orphan is dependent on the society. In Zanzibar specifically, an orphan is a child of age between 0 to 17 years who has lost one or both of his parents.

The results displayed in Table 2.13 show that 94.6 percent of all children aged 0 to 17 years reported to have both of their parents alive, with more parents reported to be alive in the rural areas (96.1 percent) than in the urban areas (92.4 percent). Furthermore, 0.2 percent of children reported to have lost both of their parents, with this observation similar for both males and female in the rural and urban areas. This pattern is similar from both the 2009/10 and 2014/15 HBSs. However, and specifically for the 2019/20 HBS results, the proportion of children who reported to have lost only their fathers was higher (3.8 percent) than those who reported to have lost only their mothers (1.1 percent).

Table 2. 12: Percentage of Population Less than 18 Years by Survival of Parents and Area, 2009/10, 2014/15 and 2019/20 HBS

At the district level, there is no marked difference in observation for the proportion of children who reported to have both parents alive (Table 2.14). For instance, Kaskazini B district had the highest proportion of children who reported to have both parents alive (98.1 percent), followed by Chake Chake (96.8 percent), with the lowest proportion recorded in Kaskazini A district (92.1 percent).

Also, the proportion of children who reported to have lost both of their parents was considerably low through all the districts, ranging from 0.1 percent in Magharibi A and Wete districts to 0.6 percent in Kati district.

Table 2.13: Percentage of Population Less than 18 Years by Survival of Parents and District, 2019/20 HBS

District	Both parents alive	Father alive, mother dead	Mother alive, father dead	Both parents dead	Don't know	Total Population

2.7 Birth Registration or Notification

The reporting of births and deaths to health facilities (during the occurrence of an event) or to a local leader is compulsory. Table 2.15 shows that about 81.2 percent of children aged less than 18 years have a birth certificates and 17.1 percent have birth notification. The female population aged less than 18 years had marginally more birth registration (81.7 percent) compared to their male counterparts (80.7 percent). The urban population had more births registered (92.4 percent) compared to the rural population (73.7 percent). No marked differences exist between males and females with regards to birth registration in the rural areas. A less than 2 percent of children across Zanzibar, however, did not have their births registered (1.6 percent), with the rural population having higher unregistered births (2.4 percent) compared to the urban areas (0.3 percent).

Table 2.14: Percentage of Population Less than 18 Years by Birth Registration and Area, 2019/20 HBS

Registration Status	Rural			Urban			Total		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
Have Birth Certificate	73.9	73.5	73.7	91.3	93.4	92.4	80.7	81.7	81.2
Have Birth Notification	23.2	24.2	23.7	8.4	6.3	7.3	17.4	16.8	17.1
No Birth Certificate	2.5	2.3	2.4	0.3	0.3	0.3	1.7	1.5	1.6
Don't know	0.3	0.0	0.2	0.1	0.0	0.0	0.2	0.0	0.1
Total Percent	100								
Total Population	240,248	231,768	472,016	154,426	162,183	316,609	394,674	393,951	788,625

Table 2.16 shows that the proportion of the population aged less than 18 years who has a birth certificate was higher in 2014/15 HBS (86.7 percent) than in 2019/20 HBS (81.2 percent).

Table 2.15: Percentage of Population Less than 18 Years by Birth Registration, 2014/15 and 2019/20 HBS

Registration Status	2014/15	2019/20
Have Birth Certificate	86.7	81.2
Have Birth Notification	10.3	17.1
No Birth Certificate	2.7	1.6
Don't know	0.3	0.1
Total Percent	100	100
Total Population	727,360	788,625

It is worth mentioning that the birth of many children are most often registered in Zanzibar when the children are about to enrol in schools, as birth certificates are some of the key requirements for enrolment in Zanzibar. The results show that the highest proportion of children with birth certificates belonged to the age group 5-9 years compared to the other age groups. Moreover, a 30.7 percent of children who have birth notification are within the age group of 0-4 years, indicating that parents do not often consider registering the birth of their children when the children are within the 0-4 age group (Table 2.17).

Table 2.16: Percentage of Population Aged Less than 18 Years by Birth Registration Status and Age Group, 2019/20 HBS

CHAPTER THREE: EDUCATION AND HEALTH

3.1 Introduction

This chapter presents the main findings for both education and health, providing trends over 2009/10, 2014/15 and 2019/20. In this chapter, education is analysed using the following indicators - literacy, school attendance, enrolment, dropout, educational attainment, mode of transport to school, and the distance to school. The health indicators analysed include the type of health provided, the source of care, whether individuals had been ill over the last 4 weeks preceding the survey and the distance to health facilities.

3.2 Education

Education is one of the most important factors in social development. Education has been found to be highly associated with various socio-economic variables, including income and fertility.

3.2.1 Literacy Rates

Table 3.1 shows the results of literacy rate for people aged 15 years and above. Literacy rate is defined as the percentage of the population aged 15 years and above who can both read and write with an understanding of a short statement regarding their everyday life.¹ The 2019/20 HBS measures literacy for adult who can read and write either Swahili or English or both, with the result revealing that 87.4 percent of the adult population were literate, which represents an increase by about 4 percentage points from the 2014/15 figure. About 60.9 percent of the population aged 15 years and above is literate in English and Swahili, with more people in the urban areas literate in English and Swahili (75.4 percent) than in the rural areas (47.6 percent). Table 3.2a further indicates that literacy rate has steadily increased over the past decade. There exists some gender disparity in literacy, with the results showing that literacy rate was higher for males in relation to females across every district in Zanzibar.

¹ <http://uis.unesco.org/en/glossary-term/adult-literacy-rate>

3.2.2 Illiteracy Rates

Adult illiteracy as known as percentage of the population aged 15 years and over who can neither read nor write or both, including the understanding of a short statement regarding their everyday life³.

Table 3.4 illustrates the percentage of illiterate adult population by age group and area. Illiteracy is generally higher in rural areas (19.1 percent) compared to urban (5.4 percent). The 2019/20 results show a decline of illiteracy rate from the previous surveys. In terms of gender (Table 3.5), the results show that across the three surveys, females have higher illiteracy rates compared to males.

Table 3. 3 Percentage of Illiterate Adult Population by Age Group and Area, 2009/10, 2014/15 and 2019/20 HBS

³ <http://uis.unesco.org/en/glossary-term/adult-literacy-rate>

In conclusion, there is a notable gender illiteracy gap in Zanzibar, with females having lower literacy scores than males over the past three surveys. The gap is, however, narrower among youth and young adults, reflecting the increased participation of girls in education in younger cohorts (Table 3.4). Generally, the illiteracy scores in 2019/20 show a decline in relation to the previous two surveys.

Table 3. 4 Percentage of Illiterate Adult Population by Age Group and Sex, 2009/10, 2014/15 and 2019/20 HBS

Age Group	2009/10			2014/15			2019/20

3.2.3 Education Level

The results from Table 3.5a revealed that 53.6 percent of the population aged 4 to 14 years has attained primary education. There is a decrease in the population with no education from this young age group from 17.2 percent 2014/15 to 10.2 percent 2019/20. Also, there is an increase in population with pre-school education from 11.2 percent in 2014/15 to 32.4 percent 2019/20. This increase in pre-school education could be due to the new Zanzibar's education policy which makes pre-school education compulsory for every child.

Table 3. 5a Percentage of Population Aged 4-14 Years by Highest Level of Education Achieved by Sex, 2009/10, 2014/15 and 2019/20 HBS

Total Percent	100									
Total Individuals	174,151	172,049	346,200	194,862	190,688	385,550	240,304	247,389	487,693	

Illiteracy within the population aged 15 years and above (Table 3.5b) in 2019/20 has fallen by about 6 percentage points compared to 2014/15 HBS. This decline is higher for females (7.3 percentage points) than males (3.9 percentage points). About 52.5 percent attained secondary education, with female attainment increasing by 5.2 percentage points compared to the males (0.2 percentage points) from 2014/15 to 2019/20 HBS. Furthermore, a 2.8 percent of the population had a university education, with female education increasing by about 2 percentage points compared to a 0.6 percentage point of male from 2014/15 to 2019/20 HBS. From the 2019/20 HBS, the population with other certificates has increased for about two percent for both males and females from their 2014/15 values. As little as 0.1 percent of the population has attained alternative education from the 2019/20 HBS results.

⁴ Increasing of pre-school education in this survey due to the implementation of new policy in 2016 for the compulsory pre-primary education.

The results from Table 3.6a show that there is decline in illiteracy for both rural and urban areas (by 8.3 rural and by 4.8 percent urban) from 2014/15 to 2019/20 HBS. There is a slight decrease in the number of children with primary education in both rural and urban areas from 2014/15 to 2019/20 HBS. Also, there is an increase in the population who attained pre-school by more than 32 percentage points for both the rural and urban areas, and this could be due to the new education policy that require every child to attend pre-school.

Table 3. 6a: Percentage of Population Aged 4-14 Years and Highest Level of Education Achieved by Area, 2009/10, 2014/15 and 2019/20 HBS

Additionally, Table 3.6c shows that Kaskazini Pemba and Kusini Pemba regions had the highest illiteracy among children compared to other regions (17.6 percent and 14.0 percent respectively) while Kusini Unguja had lowest illiteracy with 4.4 percent. With respect to the population aged 15 years and above, Table 3.6d shows that Pemba regions had higher illiteracy than Unguja regions (26.3 percent Kaskazini Pemba and 17.7 percent Kusini Pemba) while Mjini Magharibi had the lowest (4.9 percent). Mjini Magharibi had the highest population with secondary education (60.1 percent) and Kaskazini Pemba had the lowest (35.6 percent). Finally, Mjini Magharibi had 4.5 percent of the population with university education while Kusini Unguja had the lowest with 0.9 percent.

3.2.4 Enrolment Ratio

Enrolment ratios depict the proportions of children currently attending school. There are three definitions used within this report:

1. *Basic education = aged 7-16 years and attending primary levels Standards 1 to 8 or Forms 1 to 4 of secondary school*
2. *Primary enrolment = aged 7-13 and attending primary levels Standards 1 -8*
3. *Secondary enrolment = aged 15-20 attending secondary school Forms 1-6*

Net ratio means that pupils of the relevant age group are currently attending school and **Gross** ratio means that pupils of any age group are currently attending school.

Basic education net and gross enrolment ratios are shown in Table 3.7. Over eight of every ten (85.7 percent) of school-age children (6-13 years) were enrolled in school (net enrolment ratio). This marks a slight increase compared to the previous two surveys (83.7 percent and 80.3 percent in 2014/15 and 2009/10 respectively).

Table 3. 7: Basic Education Net and Gross Enrolment Ratio by Sex and Area, 2009/10, 2014/15 and 2019/20 HBS

Sex	2009/10			2014/15			2019/20		
	Rural	Urban	Total	Rural	Urban	Total	Rural	Urban	Total
Male									
Net Enrolment Ratio	77.9	84.8	80.1	77.5	88.3	82.9	79.5	89.4	84.5
Gross Enrolment Ratio	88.1	96.3	90.7	90.6	105.2	97.9	104.2	121.4	112.8
Female									
Net Enrolment Ratio	76.1	88.2	80.4	81.6	87.5	84.0	83.9	90.1	87.0
Gross Enrolment Ratio	85.2	95.6	89.0	93.1	104	98.5	102	113.1	107.5
Total									
Net Enrolment Ratio	77.3	86.7	80.3	79.5	87.9	83.7	82.4	90.4	85.7
Gross Enrolment Ratio	87.4	95.7	89.8	91.8	104.6	98.2	96.6	112.8	103.3

The gross enrolment ratio (i.e. pupils of any age attending primary or secondary school) is higher in 2019/20 (103.3 percent) than 2014/15 (98.2 percent). Basic education enrolment is higher in urban areas (112.8 percent) than rural areas (96.6 percent). Also, in terms of gender disaggregation, the results show a slight increase for both gross and net enrolments for both males and females from the previous surveys.

At the district level, the Table 3.8a shows that the net enrolment ratio has increased for some districts but not for some other districts across the survey periods. For instance; Kusini district had the highest net enrolment ratio (92.0 percent) while Micheweni had the lowest (67.9 percent), and these values showed a decline from the results of the 2014/15 HBS.

All the districts have experienced marked increases in Gross Enrolment Ratio. Specifically, Magharibi B had the highest rate (117.2 percent) while Micheweni had the lowest rate (86.4 percent). Apart from Micheweni district, the Gross Enrolment Ratio for all the districts are in excess of 100 percent. The Gross Enrolment Ratio exceeding 100% may be because there is late enrolment, early enrolment, or repetition or the total enrolment can exceed the population of the age group that officially corresponds to that level of education.

Table 3. 8a: Basic Education Net and Gross Enrolment Ratio by District, 2009/10, 2014/15 and 2019/20 HBS

District	Net Enrolment Ratio			Gross Enrolment Ratio		
	2009/10	2014/15	2019/20	2009/10	2014/15	2019/20
Kaskazini A	79.6	78.6	85.6	93.9	93.5	112.6
Kaskazini B	82.9	83.1	87.5	93.1	95.7	108.8
Kati	88.5	86.1	89.7	99.4	98.5	110.3
Kusini	90.2	94.6	92.0	103.8	105.3	110.5
Mjini	88.3	88.3	90.4	97.4	109.8	116.7
Magharibi A	82.6	87.4	88.7	90.3	101.3	114.6
Magharibi B	-	-	90.6	-	-	117.2
Wete	79.6	80.6	82.5	86	91.2	100.6
Micheweni	60.8	68.4	67.9	70.5	80.6	86.4
Chake Chake	79.9	82.1	87.0	91.2	95.2	114.6
Mkoani	71.6	79.2	77.6	81.5	92.8	101.7
Total	80.3	82.8	85.7	89.8	96.4	103.3

Among all the regions, Mjini Magharibi had the highest net and gross enrolment ratios for basic education while Kaskazini Pemba had the lowest gross and net enrolment ratios (Table 3.8b)

Table 3. 8b: Basic Education Net and Gross Enrolment Ratio by Region, 2019/20 HBS

Region	Net Enrolment Ratio	Gross Enrolment Ratio
Kaskazini Unguja	86.5	110.8
Kusini Unguja	90.5	110.4
Mjini Magharibi	90.0	116.2
Kaskazini Pemba	74.8	93.1
Kusini Pemba	82.1	107.9
Total	85.7	103.3

From the 2019/20 HBS, the Net Enrolment Ratio in primary school for both rural and urban areas have decreased compared to the previous surveys while gross enrolment has increased significantly (Table 3.9). The Net Enrolment Ratio is higher for females (83.7 percent) than males (80.5 percent) while the Gross Enrolment Ratio is marginally higher for males (116.4 percent) than females (111.5 percent). A similar pattern is observed for males and females in rural and urban areas. The gross ratio exceeding hundred percent could be due to over age and under age enrolment of children.

Table 3.9: Primary Education Net and Gross Enrolment Ratio by Sex and Area, 2009/10, 2014/15 and 2019/20 HBS

Sex	2009/10			2014/15			2019/20 ⁵		
	Rural	Urban	Total	Rural	Urban	Total	Rural	Urban	Total
Male

Gross Enrolment Ratio	100.9	104.7	102.5	98.9	105.6	102.2	110.9	118.0	113.7

At the district level, Micheweni had the lowest net and gross primary enrolment ratios of 61.0 percent and 92.9 percent respectively. The Gross Enrolment Ratio has increased across the districts from the 2019/20 HBS compared to the previous surveys except for Kusini (Table 3.10a).

Regionally, Kusini Unguja had the highest Net Enrolment Ratio; Mjini Magharibi had highest Gross Enrolment Ratio for primary education while Kaskazini Pemba had lowest in both indicators (Table 3.10b)

Table 3.10a: Primary Education Net and Gross Enrolment Ratios by District, 2009/10, 2014/15 and 2019/20 HBS

DISTRICT	Net enrolment ratio			Gross enrolment ratio

⁵The change of Education policy in Zanzibar whereby primary education started at aged 6 and secondary education at age 12 and compulsory pre-education for two years at age 4. During Survey age cohort who started From I in 2016 where in Form IV in 2019.

Table 3. 10b: Primary Education Net and Gross Enrolment Ratio by Region, 2019/20 HBS

Region	Net Enrolment Ratio	Gross Enrolment Ratio
Kaskazini Unguja	84.3	112.5
Kusini Unguja	89.4	114.5
Mjini Magharibi	86.6	117.9
Kaskazini Pemba	69.7	101.6
Kusini Pemba	76.8	116.7
Total	81.4	113.7

Table 3.11 shows that net and gross enrolment ratios at the secondary level of education were 52.3 and 65.7 percent respectively, which are both higher than the values from the 2014/15 HBS (11.5 percent more for net enrolment and 15.1 percent more for gross enrolment). Secondary education enrolment was higher in urban areas than rural areas. It is interesting to note that female secondary school enrolments have exceeded male enrolments since the 2009/10 survey in both the rural and urban areas.

Table 3. 11: Secondary Education Net and Gross Enrolment Ratio by Sex and Area, 2009/10, 2014/15 and 2019/20 HBS

Sex	2009/10			2014/15			2019/20		
	Rural	Urban	Total	Rural	Urban	Total	Rural	Urban	Total

Total									
Net Enrolment Ratio	39.8	55.6	46.1	34.8	60.3	40.5	44.3	61.6	52.1
Gross Enrolment Ratio	45.7	67.0	53.8	41.8	76.8	50.6	55.6	78.1	65.7

In examining the net and gross enrolments for secondary education by district, we can observe that there has been a considerable increase across all eleven districts except for Mkoani (Table 3.12a). Kusini and Magharibi A had the highest net and gross enrolment ratios respectively (62.6 percent Kusini and 82.5 percent Magharibi B). Micheweni depicts the lowest net and gross enrolment ratios, which is that three in every ten people were enrolled in secondary school (27.9 percent and 35.8 percent respectively).

Table 3.12a: Secondary Education Net and Gross Enrolment Ratio by District, 2009/10, 2014/15 and 2019/20 HBS

District	Net Enrolment Ratio			Gross enrolment ratio		
	2009/10	2014/15	2019/20	2009/10	2014/15	2019/20
Kaskazini A	37.9	35.2	53.0	41.6	44.7	69.0
Kaskazini B	35	34.1	47.3	40.9	43	58.2
Kati	47.2	37.1	47.8	51.9	45.4	51.1

Chake Chake	46.1	36.8	53.7	56	49.4	69.7
Mkoani	39.9	39.2	31.4	50.4	44.5	41.2
Total	46.1	38.2	52.1	53.8	46.8	65.7

Table 3.12b shows that the net and gross enrolment ratios were highest for Mjini Magharibi (59.8 percent and 76 percent respectively) while Kaskazini Pemba had the lowest enrolment ratios. Put differently, six in every ten people are enrolled in secondary school for Mjini Magharibi while three in every ten people are enrolled in secondary school for Kaskazini Pemba.

Table 3. 12b: Secondary Education Net and Gross Enrolment Ratio by Region, 2019/20 HBS

Region	Net Enrolment Ratio	Gross Enrolment Ratio
Kaskazini Unguja	50.5	64.3
Kusini Unguja	52.7	56.2
Mjini Magharibi	59.8	76.0
Kaskazini Pemba	33.6	45.8
Kusini Pemba	42.6	55.6
Total	52.1	65.7

3.2.5 School Attendance and Dropout Rates

Table 3.13a shows that the proportion of children aged 6-13 years attending school has slightly increased in 2019/20 from the previous surveys. The attendance of both males and females also increased in urban areas from 2009/10 to 2019/20 HBS but decreased from rural areas within the same periods. School attendance is higher among children residing in urban areas in relation to children residing in the rural areas.

Table 3. 13a: Percentage of Children Aged 6-13 Years Attending School by Area and Sex, 2009/10, 2014/15 and 2019/20 HBS

Area	2009/10			2014/15			2019/20		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
Rural	78.5	78.9	78.7	91.7	93.7	92.7	89.8	92.6	91.2
Urban	88.1	90.2	89.2	94.4	93.4	93.9	97.3	97.1	97.2
Total	82.4	83.9	83.1	92.8	93.6	93.2	92.8	94.5	93.6

Table 3.13b depicts that more than ninety percent of children aged 6-13 years from all the districts for both genders are attending school except for Micheweni, Wete and Mkoani which are below the 90 percent mark. Also, school attendance is higher among female children than male children in all the districts of Zanzibar except for Magharibi B, Mkoani and Micheweni.

Table 3. 13b Percentage of Children Aged 6-13 Years Attending School by District 2019/20 HBS⁶

District	Male	Female	Total
Kaskazini A	92.3	98.0	95.2
Kaskazini B	92.2	96.5	94.4
Kati	90.5	99.4	94.3
Kusini	98.1	99.3	98.7
Mjini	98.1	98.4	98.3
Magharibi A	94.4	97.1	95.8
Magharibi B	99.1	98.0	98.5
Wete	87.1	90.9	88.9
Micheweni	82.9	79.6	81.3
Chake Chake	94.1	97.7	96.0
Mkoani	91.4	87.5	89.5
Total	92.8	94.5	93.6

At the regional level, about 93 percent of children aged 6-13 years are attending school from all regions except for Kaskazini Pemba (84.9 percent). Marginally, more female children are attending school than male children in all regions (Table 3.13c).

Table 3. 13c Percentage of Children Aged 6-13 Years Attending School by Region 2019/20 HBS

Region	Male	Female	Total
Kaskazini Unguja	92.3	97.3	94.8

Kusini Pemba	92.6	92.7	92.7
Total	92.8	94.5	93.6

⁶ Percentage of population aged 6-13 years who are attending to schools out of total population of that age

The Dropout Rate is the proportion of students leaving school early before completing their basic education. Table 3.14 shows the percentage distribution of dropout among children aged 6-13 years by class and area. The results reveal that dropout rate is higher among children in lower classes compared to their colleagues in upper classes.

There are many reasons that explain the dropout rate among children in Zanzibar. Table 3.16 shows that of all children who ever dropped out of school, 70.4 percent were not interested or thought school was useless, with 79.1 percent of male dropout and 51.6 percent of female dropouts alluding to this reason. In 2019/20, there is no dropout because of pregnancy compared to 0.8 percent 2014/15 HBS. Sickness was behind more female dropouts than male dropouts, while about 3.4 percent of males drop out of school because of the need to work. No females drop out of school for work reasons in Zanzibar.

3.2.6 Distance to School and Mode of Transport

The distance and the time taken to travel to and from school are among the factors affecting children's access to school in Zanzibar. These factors particularly affect young children (Standard 1 and Standard 2 of primary school). The results in Table 3.17 show that virtually all pupils (90.1 percent of primary and 78.0 percent of secondary school students) walk to and from school. In the rural areas, the proportion of children who walked to primary school is 94.2 percent and 87.2 percent to secondary school. Also, the proportion of pupil using public transport has slightly increased for both primary and secondary schools from 2014/15 HBS to 2019/20 HBS.

Table 3. 17: Percentage of Mode of Transport to School by Area, 2014/15 and 2019/20 HBS

Table 3.18 shows the mean amount of time spent travelling to school by different means of transport. The average time spent walking to primary school is 12 minutes and to secondary school is about 14 minutes, which is lower compared to the previous survey. Students residing in the urban areas spend fewer minutes to walk to school compared to students residing in rural areas. Additionally, it takes students residing in the urban areas about 30 minutes to travel by public transport to primary schools compared to students in the rural areas who spend about 11 minutes. Furthermore, it takes 17 minutes to secondary school for students in the urban areas compared to 14 minutes for students in rural areas.

Table 3. 18: Mean Amount of Time (in minutes) Spent Travelling to School and Mode of Transport by Area, 2009/10, 2014/15 and 2019/20 HBS

Total Percent	19.1	19.6	19.4	14.9	13.3	14.0

The proportion of mode of transport for each of the districts in Zanzibar is displayed in Table 3.19a. There is very little variation in the mode of transport between the districts with pupils walking to school except for Mjini, whose students walking to school is noticeably the lowest with 78.3 percent. Public transport is common in Mjini, Magharibi A and Magharibi B especially to secondary school. Table 3.19b show that the most common means to reach school is by walking for all the four regions of Zanzibar. The use of bicycle as a mode of transport to both primary and secondary schools is highest for Kusini Unguja. Using public transports to secondary school is most common in Mjini Magharibi with 25.6 percent of secondary school students using public transport to school in this region.

Table 3.20a shows the mean amount of time spent travelling to school in different districts. The mean time spent to travel on foot is higher at Mkoani for both primary (33.6 minutes) and secondary (30.4 minutes) from the 2019/20 HBS. The mean amount of time travelling to primary schools is lowest in Kusini, Kaskazini B and Kati. Students in Chake Chake spend the highest mean amount of time on public transport (51.3 minutes to primary school and 50.9 minutes to secondary schools).

Table 3. 20a: Mean Amount of Time Spent Travelling to School and Mode of Transport by District, 2014/15 and 2019/20 HBS

At the regional level, Table 3.20b show that students in Kusini Pemba spend the highest mean time to walk to primary and secondary schools (29.6 minutes and 26.3 minutes respectively) while students in Kusini Unguja spend the least mean time to travel on foot to both primary and secondary schools. Furthermore, students in Kusini Pemba spend the highest mean time on public transport to primary and secondary schools compared to the other regions.

The distribution of children attending school by single year is shown in appendix B3.1 and Figures 3.1 and 3.3 whereby, a greater proportion of children aged 6 -12 years are attending school.

There is an inverse relationship between age and school attendance for females, whereas the relationship between age and school attendance for males is positive.

Figure 3. 1: Percentage of Children Attending School by Single and Sex, 2019/20 HBS

3.3 Health

This section presents information on people’s health status in terms of whether they were ill during the last four weeks, the type of illness reported, whether they consulted a health service and their reasons for not using medical services. In addition, the section describes the questions on disability and type of disabilities by age group from 0 to 65+ years. This information is useful for planning and implementing the Sustainable Development Goals.

3.3.1 Health Status

During the course of the 2019/20 HBS, all interviewed members of households were requested to report on the condition of their health during the four weeks preceding the survey. Table 3.21 presents the percentage of the populations’ health status during the specified period. Almost 15 percent reported that they were sick or had injuries during the four weeks prior to the survey. The results show that the percentage of people reporting either sick or injured has minimally increased by about 4 percentage points from the 2014/15 HBS result.

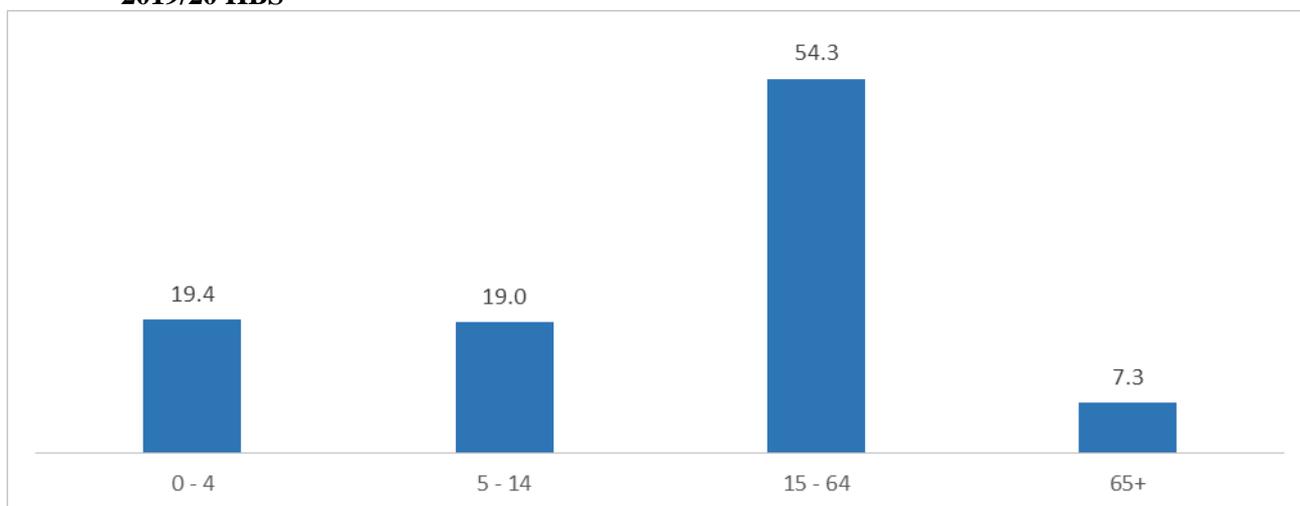

The 2019/20 HBS revealed a much smaller difference between the percentage of people reporting illness in the rural (16.9 percent) and urban (13.2 percent) areas compared to the 2014/15 HBS results which revealed the reported illness in rural areas (13.9 percent) and urban areas (8 percent).

Table 3. 21: Percentage of Population Health Status in the Last 4 Weeks by Area, 2009/10, 2014/15 and 2019/20 HBS

Area	Sick			Not sick		
	2009/10	2014/15	2019/20	2009/10	2014/15	2019/20
Rural	11	13.9	16.9	89	86.1	83.1
Urban	8.6	8	13.2	91.4	92	86.8
Total Percent	10	11.3	15.2	90	88.7	84.8
Total Individuals	126,980	165,220	247,867	1,146,343	1,291,805	1,377,722

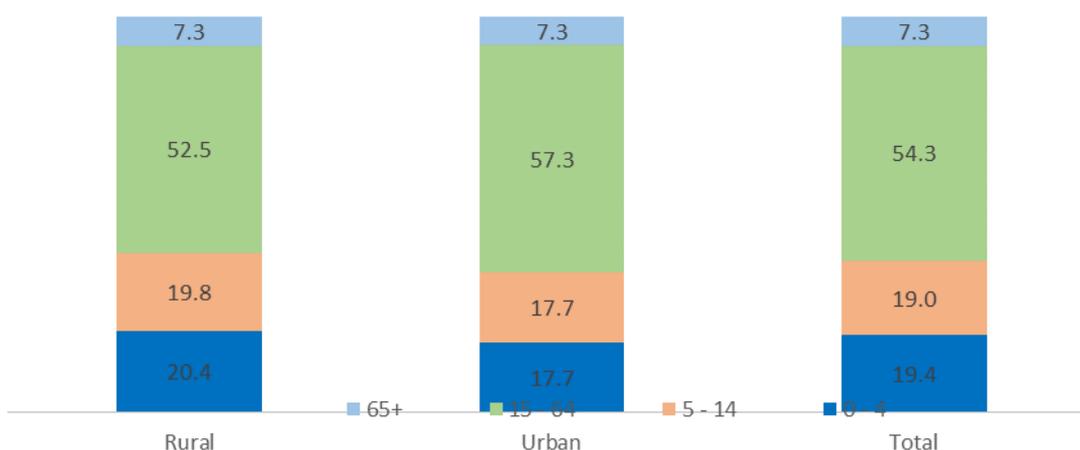

The population aged 15 – 64 years was observed as the most vulnerable to diseases as it was reported to be 54.3 percent in 2019/20 HBS as shown in the Figure 3.2. The general pattern of reporting illness between the surveys is somewhat different. There is a considerable decrease in the population reporting sick among the elderly during the 2019/20 HBS compared to the previous surveys.

Figure 3. 2: Percentage of Individuals Reported Ill or Injury in the Past Four Weeks by Age group, 2019/20 HBS

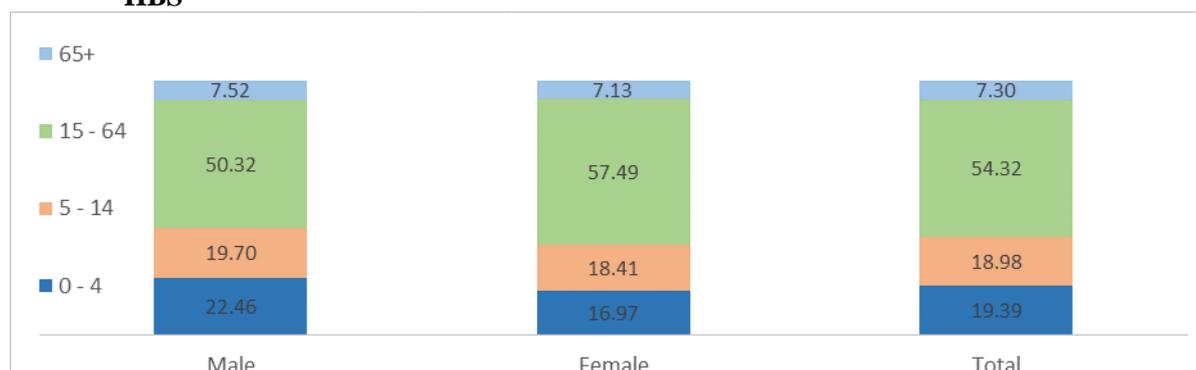

As depicted in Figure 3.3 below, apart from the proportion of respondents aged 65 years and above who reported illness or injury within the four weeks prior to the survey being the same for both rural and urban areas, a higher proportion of respondents under the age of 15 recorded more injuries or illnesses in the rural areas compared to the urban areas. In the urban areas particularly, a higher proportion of the respondents between the ages of 15-64 recorded an injury or illness (57.3 percent) compared to rural areas (52.5 percent).

Figure 3. 3: Percentage of Individuals Reported Ill or Injury in the Past Four Weeks by Area, 2019/20 HBS

High sex differences are observed for the population reporting illness during the 2019/20 HBS. Figure 3.4 shows that females aged 15 years and above reported more sicknesses. However, at the age groups of 0-4 years and 5-14 years, the percentage of males reporting an illness is higher than females. It is worth noting that the proportion of males and females who reported ill or injury decreased as age increases from 65+ years and above.

Figure 3. 4: Percentage of Individuals Reported Ill or Injury in the Past Four weeks by sex, 2019/20 HBS

The above scenario in Figure 3.6 indicates the improvements in health facilitates and the quality of life, as well as, the proportion of working age adults in the population.

3.3.2 Type of Illness or Injury

Table 3.22 describes the proportion of respondents reporting incidence of illness by type of illness or injury. The 2019/20 Zanzibar HBS has made some modification to the list of diseases or conditions to align with the Mainland 2011/12 HBS. For instance; dental diseases, Ear, Nose and Throat (ENT) and TB & Non-Communicable Diseases were added as new questions in the survey. Diabetes, which was considered as a disease on its own has been grouped in the NCD categories. In the 2004/5 HBS, fever and malaria were separated but now have their own category.

Fever is an abnormally high body temperature, which is usually accompanied by shivering, headache, and restlessness. Fever was the most reported illness during the 2019/20 HBS. More than half of the respondents of all ages had a fever complaint. There were variations in reported fever among respondents aged under fifteen years and older age groups (15 years and above). The percentage of the population under fifteen years old reported more complaints of fever (73.5 percent) than those aged 15 years and above (64.6 percent). The rural-urban differences were not so high for those reporting fever. The fever prevalence has increased by about 12 percentage points in the 2019/20 HBS compared to 2009/10 HBS (Table 3.22).

The 2019/20 HBS revealed remarkable evidence on the reduction of malaria incidence in Zanzibar. The results show that the percentage of respondents aged less than fifteen years reporting malaria was 0.7 percent, which is much lower than the previous surveys. Skin disease was the second highest reported health complaint. This is different from previous surveys where Diarrhoea was reported as the second highest illness.

It seems that the pattern of diseases has changed from communicable to non-communicable diseases (NCDs) over the years in Zanzibar. For the purpose of this study, TB and NCD were grouped together, however, the reported NCD were limited to those of chronic nature, such as diabetics and hypertension. From the 2019/20 HBS, 5 percent of respondents complained of TB and NCD. These types of conditions are more common to those aged fifteen years and above. Moreover, the population from the urban areas is more affected with these types of health problems compared to their counterparts in the rural areas.

Table 3. 22: Percentage of Type of Illness or Injury by Area, 2009/10, 2014/15 and 2019/20 HBS

Table 3.23 shows that males aged 15 years and above reported more accidents by almost 5 times more than females. The 2019/20 HBS also shows that proportion of female reporting diarrhoea was higher than males by one percentage point, which was in contrast to the 2014/15 HBS where males and females had almost the same episode of diarrhoea. However, discrepancies have been observed between the age groups for both sexes. For instance; females reported with slightly higher rate under the age of fifteen where males and females were almost the same at older ages for the episode of diarrhoea. Furthermore, females reported suffering more with anemia than males in all ages 15 years and above. During the 2019/20 HBS, fever was the most reported illnesses by respondents aged less than 15 years. The proportion of female respondents who had this complaint

is 75.5 percent, which is slightly higher by 4 percentage points than male respondents. The proportion of fever reported between 2014/15 and 2019/20 surveys has increased by 11 percentage points for females and about 6 percentage points for men.

Table 3. 23: Percentage of Type of Illness or Injury by Sex, 2009/10, 2014/15 and 2019/20 HBS

3.3.3 Disability

The 2019/20 HBS was the second HBS to collect information on disability and the questions used were identical to those used for the 2012 TPHC. Table 3.24 presents the percentage of population with disability and type of disabilities by age group. The results indicate that the older people (65 years and above) are the most affected group for all types of disability with 28.7 percent reported to have difficulties in walking or climbing steps. The proportion of this type of disability reported in 2019/20 HBS has increased by almost 18 percentage points from the 2014/15 HBS.

Difficulty seeing even with glasses is the second most reported disability by respondents aged of 65 years and above. The proportion of respondents who have this complaint is 15.1 percent, which is higher by 6.2 percentage points than recorded during the 2014/15 HBS. Furthermore, the 2019/20 HBS results indicate that persons aged 65 and above reported difficulty in remembering or concentrating as the third most common type of disability (13.1 percent), which represents an increase by 9 percentage points from the 2014/15 HBS.

Table 3. 24: Percentage of Population with Disability and Type of Disability by Age Group, 2014/15 and 2019/20 HBS

Type of Disability	2014/15						2019/20

3.3.4 Consultations

Respondents were asked whether they had sought a health consultation during the four weeks prior to the survey. For the purpose of the HBS survey, a consultation is not only limited to prescriptions from a health care provider but also services from traditional healers or buying medicine. Table 3.25a shows that among the respondents who reported sickness or injury, 67.5 percent had sought consultation from health care providers. The percentage was slightly lower in urban areas (63.8 percent) than in rural areas (69.8 percent). Additionally, the results show that consulting a health care provider was marginally higher among males (68.6 percent) than females (66.6 percent). The 2019/20 HBS results further reveal that percentage of respondents who consulted health care providers is slightly lower than the previous two surveys.

Table 3. 25a: Percentage of Ill or Injured Population who Consulted a Health Care Provider by Sex and Area, 2009/10, 2014/15 and 2019/20 HBS

Sex	2009/10			2014/15			2019/20		
	Rural	Urban	Total	Rural	Urban	Total	Rural	Urban	Total
Both Sexes	83.5	85.7	84.4	72.0	78.0	74.0	69.8	63.8	67.5
Male	85.0	84.0	85.0	70.0	78.0	73.0	69.3	67.4	68.6
Female	82.4	86.7	84.1	74.0	78.0	75.0	70.1	61.1	66.6
Total Individuals	66,836	40,282	107,118	114,426	50,794	165,220	153,044	94,823	247,867

Table 3.25b shows that among the respondents who reported sickness or injury in Zanzibar districts, consulting a health care provider was highest in Magharibi B (14.1 percent), followed by Magharibi A (12.2 percent), and lowest in Kaskazini B with 5.3 percent. The results also show that females consulted a health care provider more than males.

Table 3. 25b: Percentage of Ill or Injured Population who Consulted a Health Care Provider by Sex and Area, 2019/20 HBS

Zanzibar offers a wide range of health systems covering both the public and private sectors. The public health system has three levels of care - primary, secondary and tertiary.

In the 2014/15 and 2019/20 HBS questionnaires, a new item of 2nd level primary care (PHCU+) was added to the list of health care sources of consultation. From Table 3.26a, this improvement in the questionnaire shows that 17.9 percent of respondents consulted at a PHCU+. PHCUs are the first most used health services from the 2019/20 survey (19.7 percent). The results also reveal that the use of Over the Counter drugs (OTC) has substantially decreased by about 6 percentage points compared to the 2014/15 HBS. The use of OTC was higher in the rural areas (12.8 percent) compared to urban areas (3.2 percent). Despite the increase in private facilities, people seeking care at private health facilities (Dispensaries) is less than by almost 1.1 percentage points from the previous surveys. There is still a small minority population who seek treatment from traditional healers, FBO and traditional medicine (1.2 percent, 0.2 percent and 0.7 percent respectively).

Table 3. 26a: Percentage of Ill or Injured Population and Source of Consultation by Area, 2009/10, 2014/15 and 2019/20 HBS

3.3.5 Reasons for not using medical services

Table 3.27 shows that of all the respondents who were ill or injured but failed to consult a health care professional, 94.4 percent of them believed there was no need, 1.6 percent thought the medical services were too expensive, and less than 1 percent thought medical help was too far from them. It is encouraging to note that in 2019/20, the proportion of the ill or injured who said that medical help was too expensive declined by about 7 percentage points from the 2014/15 HBS result. Also, since the Ministry of Health has been implementing measures to provide health services closer to the communities, it is worth to note that very few respondents (less than one percent) stated that distance to the service delivery point was their reason for not using medical services.

Table 3. 27: Percentage of Ill or Injured Population Not Using Medical Care and Reason by Area, 2009/10, 2014/15 and 2019/20 HBS

Reason	2009/10			2014/15			2019/20		
	Rural	Urban	Total	Rural	Urban	Total	Rural	Urban	Total

*Other includes those who had medicine at home

At the district level, Table 3.28 shows Kati and Magharibi A are the districts with most the ill or injured people opting to use home medicine with Kusini being the region with the lowest proportion of ill or injured people applying home medicines.

Also, almost 7.1 percent of ill or injured respondents from the 2019/20 HBS who did not use medical services due to the services being too expensive for them resided in Mkoani district as compared with the 18.8 percent in Mjini district from 2014/15 HBS.

Table 3. 28: Percentage of Ill or Injured Population Not Using Medical Care by Reason and District, 2014/15 HBS and 2019/20 HBS

3.3.6 Distance to Health Facilities

Table 3.29a shows that over six out of ten of the households interviewed (63.0 percent) reported to be within less than one kilometre to the primary health facility. A higher proportion of the households in the urban areas live within less than a kilometre to a health facility (81.5 percent) in relation to the urban areas (49.5 percent).

Table 3. 29a: Percentage of Distance from Home to Primary Health Centre by Area, 2009/10, 2014/15 and 2019/20 HBS

Distance km)	2009/10			2014/15			2019/20

Total Percent	100	100	100	100	100	100	100	100	100
Total Households	136,059	96,452	232,511	148,754	113,541	262,295	169,461	123,335	292,796

At the district level, Table 3.29b shows that of all the households who reported to be within less than a kilometre to a health facility, 92.5 percent resided in the Mjini district while as low as 25.5 percent resided in the Micheweni district. About 2 percent of the households reported to be situated within more than 5 kilometres to a health facility in Chake Chake. The obtained results suggest that majority of the population lives within a less than five kilometres from their homes to the health facilities.

3.3.7 Problems During Medical Visits

Table 3.30a describes the percentage of the population facing problems during their visits to health facilities. It has been observed that only one-tenth of the respondents had faced some problems at the time they visited the health facility for medical services. The most common problem was long waiting time, with about 10 percent of the respondents who visited a health care facility encountering this type of problem. Long waiting time was observed more in the urban areas (14.1 percent) than in the rural areas (7.7 percent), with the problem in the urban areas representing an increase of about 6 percentage points from the 2014/15 results.

Availability of drugs at the facility was found as a second most common problem where 1.9 percent of the patients mentioned no drugs available. It is worth noting that this particular problem has steadily improved over the past decade with the 2019/20 result showing a decline by about 8 percentage points from the 2009/10 figure.

Table 3. 30a: Percentage of Population by Problem Faced During Health Visit and Area, 2009/10, 2014/15 and 2019/20 HBS

Problem	2009/10			2014/15			2019/20

Note: Row totals add up to more than 100 as the question was multiple response

Table 3.30b describes the percentage of the population facing a problem during their visits to health facilities by Zanzibar districts. Magharibi B district was mentioned to be the district with the highest waiting time (17.7 percent), followed by Mjini district (17.2 percent) with Kusini, Kati and Chake

Chake districts having some of the lowest waiting times. Cleanliness of the facility was also found as a second foremost problem in the facilities, especially in Wete and Magharibi B districts with 27.8 percent and 26.3 percent respectively.

Magharibi A and Magharibi B are the districts mentioned with no drugs at their facilities compared to other districts with 18.3 percent and 15.5 percent respectively.

Table 3. 30b: Percentage of Population by Problem Faced During Health Visit and district, 2019/20 HBS

District	No drug available	expensive	Facilities were not clean	No problem (satisfied)	No trained professionals	Others	Treatment unsuccessful	Long waiting time

3.3.8 Expenditure on Health Services

As it was in 2009/10 HBS, the 2019/20 HBS also sought to understand whether individuals incurred costs when visiting health care facilities and what services were paid for. The results in Table 3.31a show that 57.8 percent of the respondents said no payment was made for the medicine and almost 35.7 percent for diagnostic tests (examinations and medical tests). The percentage of people who have paid for consultation or advice has increased by about 5 percent in 2009/10 and decreased by more than 10 percent in 2014/15 HBS. Payment for health services was higher among urban residents than rural residents, and this is probably because most private health facilities are located in more urban areas than in rural areas. Notably, the results show that payment for operations slightly increased in 2019/20 from their 2009/10 figure.

Table 3. 31a: Percentage of Payment for Health Services by Area, 2009/10, 2014/15 and 2019/20 HBS

Type of Service	2009/10			2014/15			2019/20

Note: Row totals add up to more than 100 as the question is multiple response

The results in Table 3.31b describe the comparability of payment in health services among Zanzibar districts. The results show that 35.7 percent of the respondents paid for lab or medical test while the second highest payment was 19.1 percent for consultation. The districts with high payment for health services in examinations and medical tests were Magharibi B and Magharibi A (62.6 percent and 58.5 percent respectively). Also, Magharibi A and Magharibi B were the only districts with high payment in health services above 50 percent compared to the other districts.

Table 3. 31b: Percentage of Payment for Health Services by District, 2019/20 HBS

District	Consultation	Lab/Medical test	Not paid	Operation/Therapy	Total
Kaskazini A	6.9	34.1	64.2	0.0	100

CHAPTER FOUR: HOUSING DWELLINGS, DURABLES AND WATER AND SANITATION

4.1 Introduction

The analysis of the housing characteristics discussed in this chapter provides an overview of the construction material of the main dwelling units, type of tenure, ownership of dwelling, sleeping rooms, electricity connection, sources of main fuel for both cooking and lighting, consumption of fire wood and charcoal, toilet facilities, drinking water and solid waste disposal.

4.1.1 Construction Materials of Floors, Walls and Roofs

The results presented in Table 4.1 shows that over eight out of ten households in Zanzibar are living in dwelling units where the floor is made from concrete, cement, tiles or timber (83.9 percent), whereas 16.1 percent are living in dwellings with an earth floor. More urban households live in homes whose floor is made from concrete, cement, tiles or timber than rural households.

With respect to House Walls, just 16.0 percent of households in Zanzibar live in dwellings where the walls are made up of poles, mud or stone while most of the households (82.7 percent) live in dwellings made up of modern materials (concrete, cement or stone). The percentage of households who have walled their houses with concrete, cement and stones have steadily increased over the past 10 years, with more urban households using these walling materials in relation to their rural counterparts (Table 4.1).

Table 4.1: Percentage of Construction Materials of Main Dwelling by Area, 2009/10, 2014/15 and 2019/20 HBS

Construction Material	2009/10			2014/15			2019/20

Grass / leaves	36.3	7.7	24.4	24.0	2.0	14.5	14.5	0.8	8.4
Concrete	0.0	2.4	1.0	0.0	2.7	1.2	0.7	3.3	1.9
Metal sheets	62.6	89.1	73.6	74.8	93.5	82.9	84.5	95.3	89.3
Tiles	0.7	0.1	0.5	0.7	1.8	1.1	0.2	0.4	0.2
Other	0.4	0.8	0.5	0.5	0.0	0.3	0.1	0.3	0.2
Total Percent	100	100	100	100	100	100	100.0	100.0	100.0

Furthermore, metal sheets are, by far, the most common roofing material, both in the rural and urban areas (84.5 percent and 95.3 percent respectively). At the national level, 89.3 percent of households used metal sheets as roofing materials which reflects a noticeable improvement on the 82.9 percent reported in 2014/15 HBS.

4.1.2 Tenure and Ownership

The results of the 2019/20 HBS show that owner occupancy is more prevalent in rural areas (88.1 percent) than urban areas (72.4 percent). In urban areas, there is a slight rental market while in rural areas there is practically none. There has been a small decrease over the past five years in the proportion of households living in owner-occupied dwelling units, from 83.7 percent in 2014/15 to 81.1 percent in 2019/20 HBS.

Table 4.2: Percentage of Households and Type of Tenure by Area, 2009/10, 2014/15 and 2019/20 HBS

Tenure	2009/10			2014/15			2019/20		
	Rural	Urban	Total	Rural	Urban	Total	Rural	Urban	Total
Owned by household	92.1	69.2	82.6	89.3	76.5	83.7	88.1	72.4	81.1

Other	0.1	1.6	0.6	0.1	0	0.1	0.0	0.6	0.3
Total Percent	100	100	100	100	100	100	100.0	100.0	100.0
Total Households	136,059	96,452	232,511	148,754	113,541	262,295	166,985	133,896	300,881

The results presented in Table 4.3 reveal notable variations in ownership of dwelling units with a much higher proportion owned by men (75.0 percent) compared to women (21.1 percent). The same pattern is shown in both rural and urban areas. It should be noted that 3.5 percent of dwellings are jointly owned. Joint ownership is more common in urban areas (4.4 percent) than in rural areas (2.8 percent). Joint ownership slightly increased in 2019/20 compared with 2014/15 but overall, the percentage is still quite low.

Table 4.3: Percentage of Households and Sex of Person who Owns the Dwelling by Area, 2009/10, 2014/15 and 2019/20 HBS

Sex of Owner	2009/10			2014/15			2019/20

Table 4.4 shows that female ownership is highest in Mjini (30.0 percent), while it is lowest in Kaskazini B (14.4 percent). With the exception of Mjini district which has the highest joint ownership, a joint ownership is more common within the Pemba districts compared to the other Unguja districts. The trend shows that joint ownership has been increasing over the last three surveys.

Total	82.0	16.3	1.6	100	76.4	20.1	3.1	0.4	100	75.0	21.1	3.5	0.3	100	

A sleeping room is defined as a part of a dwelling unit enclosed by four walls, floor and roof which is used by at least one member of the household for sleeping. A dwelling unit with no partition is considered as one room. The findings from Table 4.5 show that the average number of persons per sleeping room is 2.2 from the 2019/20 HBS. There is virtually no difference between urban and rural areas and there has not been a noticeable change since the previous surveys.

Table 4.5: Mean Number of People per Sleeping Room by Area, 2004/05 to 2014/15 HBS

Area	2009/10	2014/15	2019/20
Rural	2.3	2.3	2.3
Urban	2.1	2.1	2.1
Total	2.2	2.2	2.2

4.1.3 Connection to Electricity

The results from Table 4.6 show a steady improvement in the last ten years with the level of electricity connection increasing from 38.3 percent in 2009/10 to 57.0 percent in 2019/20. Big disparities still exist between the rural and urban areas of Zanzibar.

Table 4.6: Percentage of Households with Connection to ZECO Electricity by Area, 2009/10, 2014/15 and 2019/20 HBS

Area	2009/10	2014/15	2019/20
Rural	15.7	20.3	33.3
Urban	70.1	75.5	86.6
Total	38.3	44.2	57.0

Looking at electricity connection by district (Table 4.7), it is clear that Mjini (91.4 percent), Magharibi A (76.8 percent) and Magharibi B (84.2 percent) are the districts with most households connected to electricity in relation to the other districts. Micheweni district, in particular, has the lowest electricity connection (15.7 percent) among all the districts. Regarding trend over time, electricity connection has steadily increased at the national level and across all the districts of Zanzibar since 2009/10.

Table 4.7: Percentage of Households with Connection to ZECO Electricity by District, 2009/10, 2014/15 and 2019/20 HBS

District	2009/10	2014/15	2019/20

Mkoani	13.4	15.4	25.7
Total	38.3	44.2	57.0

4.1.4 Energy Sources for Cooking and Lighting

The results from Table 4.8. show that about two thirds (67.1 percent) of the households use renewable energy (Electricity, solar and charging lights) for lighting whereby electricity is the most common source (57.0 percent) used than the others. The findings further show that the proportion of households using non-renewable energy sources has been decreasing for the past three surveys, unlike previous surveys where the Paraffin/Kerosene lamps were highly used in most of households. The use of paraffin/kerosene lamps is higher in rural areas while in the urban areas, there is a notable shift from paraffin kerosene lamp to electricity (86.6 percent).

Although the proportion of households using firewood has been decreasing for the past three surveys, the use of firewood for cooking in Zanzibar is still the most common (52.8 percent), followed by charcoal (34.1 percent). Furthermore, even though the use of electricity for cooking has slightly increased over the past three surveys. The proportion of households that use electricity for cooking is still low (2.6 percent) in 2019/20 and the use of gas has increased by 6.6 percentage points between 2014/15 and 2019/20.

Table 4.8: Percentage of Households by Source of Energy for Lighting and Cooking by Area, 2009/10, 2014/15 and 2019/20 HBS

During the 2019/20 HBS, the households were asked how much they usually paid for their main energy sources and some other common expenditures related to housing. The results presented in Table 4.9 show that 57 percent of the households reported paying an average of 26,402 TZS a month for electricity. Almost two-third (63.8 percent) of households spent an average of 5,321 TZS a month buying Kerosene while over nine out of ten households (91.6 percent) reported spending an average of 14,003 TZS a month on a mobile phone related expense.

⁷ The under representation of the urban population in the 2009/10 sample design created an unusual trend for reporting of electricity over time. Electric connectivity is an urban phenomenon and in 2009/10 the urban sample was small and so the results dropped, but this was not the real situation. See Annex A2 for more detail.

Table 4.9: Average Monthly Expenditure (TZS) on Housing and Other Common Goods, 2019/20 HBS

Expenditure item	Monthly Mean Average	Number of Households	Percentage of households reporting type of expenditure
Electricity (ZECO)	26,402	171,572	57.0
Charcoal	20,490	139,747	47.7
Firewood	16,538	149,049	50.9
Kerosene	5,321	186,924	63.8
Mobile telephone bill (including top-up cards)	14,003	268,115	91.6
TV subscription (cable and digital TV included)	12,964	80,818	27.6

4.1.5 Ownership of Durable Goods

Generally, there has been an increase in the purchase of non-food products in the HBS 2019/20 for all items compared to the 2014/15 HBS. For this reason, it appears from Table 4.10 that the ownership of durable goods has increased over time. Mobile phones are a good example, with the results revealing that 92.1 percent of households own mobile phone compared to just 59 percent ten years ago. The percentage of households that owned television has increased to 47.7 percent in 2019/20 from 29.6 percent in 2014/15 HBS. The results further reveal that in exception of bicycles and mosquito nets, more urban households owned non-food products than rural households across the three survey periods.

4.2 Water and Sanitation

4.2.1 Introduction

This section examines access to drinking water in terms of water source, the distance travelled and the time taken to fetch water. It also looks at the sex of the people who generally collect water. Later in the section, the type of toilet facilities available in the household and whether toilets are shared with other households are also discussed. Finally, hand washing facilities and the methods of disposal of the stools of children and solid waste are also observed.

4.2.2 Access to Improved Drinking Water

Increased access to safe drinking water results in improved health outcomes by reducing cases of water-borne diseases such as dysentery and cholera. The 2019/20 HBS collected information on drinking water, distance to drinking water, time taken to fetch drinking water, persons who usually fetch drinking water and household water consumption. A household is classified as having access to improved drinking water if it uses private piped water to the house, private piped water outside housing unit, piped water on neighbour's housing unit, piped water on community supply, protected dug well and protected dug well inside the house.

Table 4.11 shows that 91.1 percent of households used improved water sources. Private piped water to dwelling is the most common source of drinking water (36.3 percent), while public tap or standpipe is the second most common source (25.2 percent). In urban areas, nearly all households (95.6 percent) have access to safe drinking water while it is 87.6 percent in rural households. There has been some improvement in access to safe drinking water over the past decade, even though this improvement is quite marginal.

Table 4.11: Percentage of Households and Main Source of Drinking Water by Area, 2009/10, 2014/15 and 2019/20 HBS

Water Source	2009/10			2014/15			2019/20

Table 4.12 shows that the majority of households (78.3 percent) stored water in buckets with a lid. The proportion of households using an overhead tank for storing drinking water has about doubled (5.6 percent) in 2019/20HBS compared to the 2.6 percent recorded in 2014/15 HBS. Storing water in buckets with a lid is more prevalent in rural households compared to their urban counterparts.

Table 4.12: Percentage of Households Using Containers for Storing Drinking Water and Type of Container by Area, 2014/15 and 2019/20 HBS

Storage Method	2014/15			2019/20

In terms of actions taken to ensure the safety drinking water, around seven of every ten households (70.4 percent) treat water with chemicals, while 12.8 percent do not treat their drinking water in anyways (Table 4.13).

Table 4.13: Percentage of Households and Measures Taken to Ensure Safe Drinking Water by Area, 2014/15 and 2019/20 HBS

Method	2014/15			2019/20

4.2.3 Distance to and Time Taken for Collecting Drinking Water

One of the development goals of the Revolutionary Government of Zanzibar is to ensure that all households have access to safe drinking water within a reasonable distance from their homes to minimize the time spent fetching water. Nearly all households (98.8 percent) access drinking water within one kilometre during the dry season. In both urban and rural areas, nearly all households do not have to travel more than one kilometre to fetch drinking water during the dry season. There has been a noticeable improvement in this indicator since 2009/10.

⁸ The 2019/20 HBS included all households received water from ZAWA as they have ‘treated with chemicals’, but previous surveys only included households who treated water with chemicals at home and those received from ZAWA as ‘None’

At the district level, about 5.2 percent of households in Micheweni travel within one or more kilometres to fetch water during the dry season (Table 4.15). However, none of the households in Kaskazini A, Kusini and Mjini travel more than a kilometre to fetch drinking water.

Table 4. 14: Percentage of Households and Distance to Drinking Water in the Dry Season by Area, 2009/10, 2014/15 and 2019/20 HBS

Distance to Water	2009/10			2014/15			2019/20		
	Rural	Urban	Total	Rural	Urban	Total	Rural	Urban	Total
Less than 1 km	81.9	90.4	85.4	95.3	99	96.9	98.0	99.7	98.8
1 to 1.9 km	11.5	6.6	9.5	4	0.8	2.6	2.0	0.3	1.2
2 + km	6.4	2.9	5	0.7	0.2	0.5	0.0	0.0	0.0

Wete	98.0	2.0	0.0	100
Micheweni	94.8	5.2	0.0	100
Chake Chake	99.0	1.0	0.0	100
Mkoani	98.1	1.9	0.0	100
Total	98.8	1.2	0.0	100
Total Household	297,212	3,668	0.0	300,881

The time spent for fetching drinking water has an impact on people's participation in economic activities and on generating income. The data from Table 4.16 show that majority of households (91.8 percent) spend less than 15 minutes fetching drinking water during dry season. The average time taken to fetch drinking water is 3.4 minutes across Zanzibar.

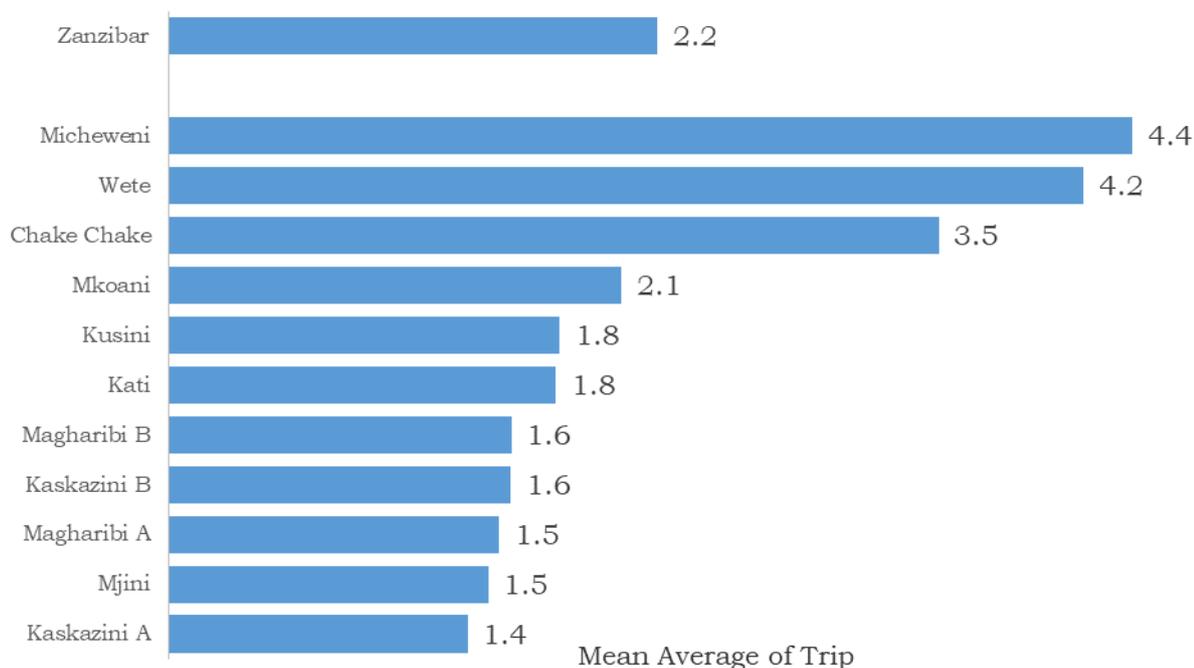

Table 4.16: Percentage of Households Usual Time Spent Fetching Drinking Water During Dry Season by Area, 2009/10, 2014/15 and 2019/20 HBS

Time Spent	2009/10			2014/15			2019/20		
	Rural	Urban	Total	Rural	Urban	Total	Rural	Urban	Total
Zero minutes	21.6	53.7	34.9	31.6	64.1	45.7	66.0	87.7	75.7
1-14 minutes	51.4	30.2	42.6	50.8	26	40.1	22.5	8.1	16.1
15-29 minutes	17.7	8.9	14.1	8.0	6.2	7.2	5.5	1.9	3.9

Total Percent	100	100	100	100	100	100	100	100	100
Mean Time spent fetching water (Minutes)	10.1	6	8.4	8.8	4.5	6.9	4.6	1.8	3.4

Furthermore, the average number of trips a day made by households in Zanzibar to collect water during the dry season was 2.2 trips from the 2019/20 HBS. At the district level, Micheweni and Wete had households making

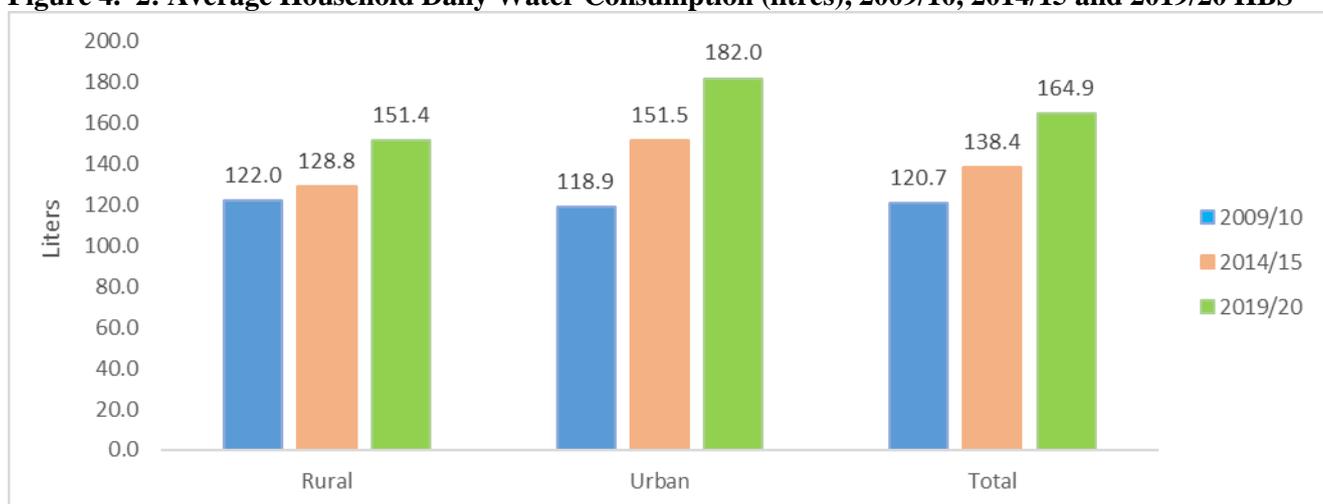

the highest number of trips per day to fetch water with 4.4 and 4.2 respectively (Figure 4.1). Additionally, households from Kaskazini A district make the fewest number of trips a day during the dry season to fetch water. Households in the urban areas made fewer number of trips to fetch water compared to the households in the rural areas (Table 4.16).

Figure 4. 1: Average Number of Trips Made a Day to Collect Water During the Dry Season by District, 2019/19 HBS

The 2019/20 HBS captured information on the household’s daily water consumption. It is recommended that for water consumption to be sufficient, every person need at least 31 litres per day. The data show that the average household daily water consumption is 164.9 litres (Figure 4.2), which aligns with the average household size of 5.3. Household daily water consumption was higher in urban areas than in rural areas. The trend shows that the average household daily water consumption has been rising since 2009/10.

Figure 4. 2: Average Household Daily Water Consumption (litres), 2009/10, 2014/15 and 2019/20 HBS

4.2.3 Water Collectors

The findings show that most of the burden of fetching drinking water is on women aged 15 and above who account for 69.0 percent compared to men with 26.5 percent (Table 4.17). The gender disparity is more obvious in rural areas with more women in the rural areas shouldering this responsibility compared to the men. Children under the age of 15 years are not much involved in collecting water.

Table 4. 17: Percentage of Households, Sex and Age of Person who Usually Collects Water by Area, 2014/15 and 2019/20 HBS

Water Collector	2014/15			2019/20		
	Rural	Urban	Total	Rural	Urban	Total
Female (15+years)	79.2	65.7	75.1	74.8	56.3	69.0

Total Percent	100	100	100	100	100	100
Total Households that Fetch Water	127,415	56,440	183,855	117,853	53,460	171,314

4.2.4 Toilet and Hand Washing Facilities

Poor sanitation coupled with unsafe water sources increase the risk of water-borne diseases and illnesses due to poor hygiene. Households without improved toilet facilities are more exposed to the risk of diseases such as dysentery, diarrhoea and typhoid fever. Table 4.18 shows in detail the variety of toilet facilities used in Zanzibar. The results show that close to four out of ten households (38.6 percent) have a flush toilet with cistern, with 27.6 percent in the rural areas and 52.3 percent in the urban areas. Worryingly, about one out of every five households in rural areas do not have a toilet facility (20.7 percent) and use the field or seashore.

Table 4.18: Percentage of Households by Type of Toilet and Area, 2019/20 HBS

Type of Toilet	Rural	Urban	Total
No toilet/bush/field/beach/river	20.7	0.6	11.7
Open pit without slab/open pit	8.9	4.6	7.0
Pit latrine with slab (washable)	6.3	3.5	5.1
Ventilated improved pit latrine	22.1	18.9	20.7
Pour flash toilet	12.2	13.2	12.6
Flush toilet with Cistern	27.6	52.3	38.6
Composting toilet/Ecosan latrine	1.1	6.8	3.6
Ecology toilet	0.1	0.0	0.1
Other (Specify):	0.9	0.1	0.5
Total Percent	100	100	100
Total Households	166,985	133,896	300,881

Over the last five years, there has been a notable improvement in the availability of toilet facilities (Table 4.19). There has been an increase in the proportion of households using flush toilets from 33.0 percent in 2014/15 to 51.3 percent in 2019/20. The households with no toilet have reduced from 16.3 percent to 11.7 percent, and this trend is observed for both the rural and urban areas.

Table 4.19: Percentage of Households and Type of Toilet by Area, 2004/05 to 2019/20 HBS

Type of Toilet	2009/10			2014/15			2019/20		
	Rural	Urban	Total	Rural	Urban	Total	Rural	Urban	Total
No toilet /seashore	33.1	2.1	20.3	27.5	1.7	16.3	20.7	0.6	11.7
Flush toilet	10.4	32.6	19.6	20.1	50.0	33.0	39.8	65.5	51.3
Pit latrine	51.6	57.8	54.1	44.7	33.8	40	15.2	8.1	12.0
Ventilated improved pit (VIP)	4.7	7.5	5.9	7.2	13.7	10	22.1	18.9	20.7
Other	0.2	0.1	0.1	0.3	0.3	0.3	2.1	7.0	4.3
Not stated	0	0	0	0.4	0.4	0.4	n.a	n.a	n.a
Total Percent	100	100	100	100	100	100	100	100	100
Total Households	136,059	96,452	232,511	148,754	113,541	262,295	166,985	133,896	300,881

The data on toilet facilities by district from the 2019/20 HBS show a marked improvement in the last 5 years (Table 4.20) across the districts of Zanzibar. It is clear that the incidence of households having flush toilets in all the districts has increased, mostly in Magharibi A and Magharibi B and least in Kaskazini A. However, a majority (55.5 percent) of households in Micheweni district are still not having toilet facilities, despite this result representing a decline from the 61.9 percent recorded in 2014/15.

Table 4. 20: Percentage of Households and Type of Toilet by District, 2014/15 to 2019/20 HBS

District	No toilet, seashore		Flush Toilet		Pit Latrine		Ventilated improved pit	
	2014/15	2019/20	2014/15	2019/20	2014/15	2019/20	2014/15	2019/20
Kaskazini A	18.0	8.6	13.7	28.3	62.9	20.4	5.0	41.2
Kaskazini B	19.2	9.2	26.0	40.2	49.5	24.7	5.3	24.2
Kati	7.0	5.9	11.4	42.3	78.9	16.2	2.3	34.8
Kusini	8.0	4.2	4.0	30.8	85.1	8.9	2.3	55.5
Mjini	0.1	0.0	46.4	61.6	44.3	9.6	8.8	22.8
Magharibi A	0.9	0.3	51.1	71.3	30.6	7.5	16.9	15.6
Magharibi B	n.a	0.1	n.a	67.4	n.a	7.9	n.a	14.3
Wete	37.9	23.7	23.2	50.3	25.0	13.1	10.1	10.4
Micheweni	61.9	55.5	19.1	30.5	14.8	5.9	3.9	6.6
Chake chake	28.6	17.6	36.3	58.9	26.9	12.4	7.7	9.2
Mkoani	34.2	35.4	23.1	30.2	26.8	16.0	15.0	15.8

Furthermore, Table 4.21 reveals that most of the households do not share a toilet facility with other households (80.7 percent) while the remaining 19.3 percent of households are sharing with another household. Sharing a toilet with another household is more common in urban areas than in rural areas.

Table 4. 21: Percentage of Households Sharing a Toilet with Other Households by Area, 2014/15 and 2019/20 HBS

Number of Households Sharing	2014/15			2019/20

More than five	0.6	0.6	0.6	.3	.6	.4
Not stated	0.5	0.4	0.5	n.a	n.a	n.a
Total Percent	100	100	100	100	100	100
Total Households with a Toilet	108,633	111,616	220,249	166,985	133,896	300,881

Moreover, those households with a toilet facility were also asked whether they had an area where hands could be washed. Most of the households (82.7 percent) did not have a hand washing facility, with the rural areas having a higher proportion of these households (88.9 percent) compared to the urban areas (76.6 percent). The proportion of households with no hand washing facility in both rural and urban increased in 2019/20 compared with 2014/15 (Table 4.22).

Table 4. 22: Percentage of Households and Hand Washing Facilities by Area, 2014/15 and 2019/20 HBS

Hand Washing Facilities	2014/15			2019/20		
	Rural	Urban	Total	Rural	Urban	Total

Yes, near the latrine	8.8	11.1	10	3.8	6.9	5.3
Yes, near the kitchen	8.4	16.1	12.3	6.2	14.3	10.3
Yes, other location	1.6	4.5	3.1	1.1	2.2	1.7
Not stated	0.5	0.4	0.5	n.a	n.a	n.a
Total Percent	100	100	100	100	100	100
Total Households with a Toilet	108,633	111,616	220,249	166,985	133,896	300,881

4.2.4 Stools and Garbage Disposal

For those households with children, they were asked how the stools of their youngest children were disposed. The results from Table 4.23 show that more than one-third (35.7 percent) of the households disposed the stools in toilet or latrine while 22.4 percent buried the stools. In the rural areas, about 34 percent of households bury child stools compared to 5.3 percent in the urban areas.

Table 4. 23: Percentage of Households and Disposal of Stools of Youngest Child by Area, 2014/15 and 2019/20 HBS

Disposal Method	2014/15			2019/20		
	Rural	Urban	Total	Rural	Urban	Total
Child used toilet/latrine	23.3	42	31	24.8	50.7	35.4
Put/rinsed into toilet/latrine	20	29.6	24	19.0	23.8	21.0
Thrown into garbage	18	15.7	17.5	19.0	19.7	19.3
Buried	31.5	8.2	21.9	34.6	4.8	22.4
Other	6.4	4.5	5.7	2.6	1.1	2.0
Total Percent	99	100	100	100	100	100
Total Households with Children	95,286	66,931	162,217	103,270	71,692	174,962

The households were also asked about the place where they normally disposed of their solid waste. The results from Table 4.24 reveal that majority of the households (57.2 percent) disposed their garbage outside household premises, while only 22.7 percent paid waste removers to manage the solid waste. Furthermore, about 46 percent of households in the urban areas paid waste removers compared to just 3.7 percent of households in rural areas (46.4 percent).

4.24: Percentage of Households and Solid Waste Disposal by Area, 2019/20 HBS

Method of Disposal	Rural	Urban	Total
Within household premises	12.9	3.5	8.8
Outside household premises	72.3	38.4	57.2
To the dust bin	3.4	4.9	4.1
Burning of waste	7.5	5.8	6.7
Pay to waste remover	3.7	46.4	22.7
Other	0.1	1.1	0.6
Total Percent	100	100	100
Total	166,985	133,896	300,881

At the district level, with the exception of Magharibi B and Mjini, where majority of the households pay to waste removers, most of the households in other districts either dump waste in their premises, dust bins or burn them.

4.25: Percentage of Households and Solid Waste Disposal by district, 2019/20

District	Within household premises	Outside household premises	To the dust bin	Burning of waste	Pay to waste remover	Other	Total

CHAPTER FIVE: ECONOMIC ACTIVITY STATUS AND AGRICULTURAL ACTIVITIES

5.0 Introduction

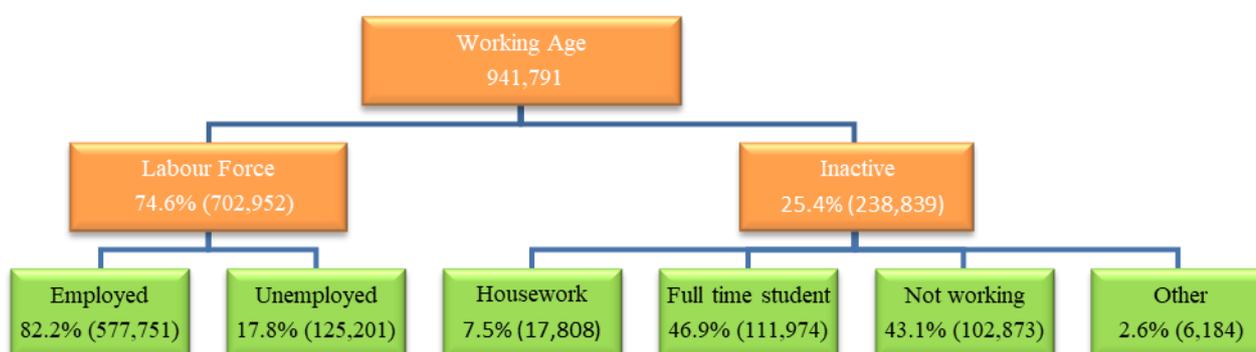

This chapter presents information on the economic and non-economic activities undertaken by household members. It also examines the characteristics of work activities engaged in by the household members. The Tables and Figures provide an overview of the main activities of individuals including employed persons by industry and occupation and unemployed persons by age group, area and sex. The Tanzania Standard Classification of Occupations (TASCO) is used to classify occupations and the International Standard of Industrial Classification (ISIC Rev.4) used to classify industry. The analysis of labour market information is based on persons aged 15 years and above and with reference to the last seven days. The questions capturing data on socio-economic status changed from the 2009/10 HBS and, therefore, comparisons with previous years cannot be made. The main survey to provide international standards of measures in this sector is the Integrated Labour Force Survey which is a more in-depth and rigorous measure of these employment and unemployment indicators. This chapter also presents information on household ownership of land, livestock and ownership of assets used for agriculture. Finally, data on household decision making based on income obtained from agriculture and livestock are also presented in this section.

5.1. ECONOMIC ACTIVITY STATUS

5.1.1 Working age population

The working age population (WAP) includes persons 15 years and above. They comprised of 941,791 persons from the 2019/20 HBS, of whom 74.6 percent were in the labour force and 25.4 percent were out of the labour force (inactive). Majority of those in the labour force were employed (82.2 percent), however, and most of the inactive persons were full time students (46.9 percent).

Figure 5.1: Distribution of Working Age Population (15 years and above) in the Last 7 Days, HBS 2019/20

5.1.2 Persons by Main Activity

The results in Table 5.1 show that the majority of respondents aged 15 years and above were employed (61.3 percent). Very few (1.9 percent) of respondents stated they were doing housework at their home, 11.9 percent were full-time students, and about 13.3 percent of persons were unemployed. This should not be interpreted as the unemployment rate! This is the ratio of unemployed persons to the total population of 15 years and above. More people in the rural areas were unemployed than their counterparts in the urban areas.

Table 5.1: Percentage of Population Aged 15 years and Above and Main Activity in the Last 7 Days by Area, HBS 2019/20

Main Activity	Rural	Urban	Total
Employed	67.5	54.7	61.3
Unemployed	9.8	17.1	13.3
Housework	1.7	2.0	1.9
Full time student	10.2	13.8	11.9
Not working*	10.3	11.7	10.9
Other	0.5	0.8	0.7
Total Percent	100	100	100
Total Individuals	491,861	449,930	941,791

*Includes the elderly, disabled who are not able to work, sick persons.

The proportion of males employed was higher (74.8 percent) than females (48.9 percent). Only 3.4 percent of females were doing housework. The proportion of males and females who were full time students were almost the same (12.2 percent and 11.6 percent respectively).

The proportion of unemployed males is lower (7.3 percent) than females (18.8 percent). The reasons for not working include people who were too young, too old, sick or disabled who are not able to work.

Table 5.2: Percentage of Population Aged 15 Years and Above and Main Activity in Last 7 Days by Sex, HBS 2019/20

Main Activity	Male	Female	Total
Employed	74.8	48.9	61.3
Unemployed	7.3	18.8	13.3
Housework	0.2	3.4	1.9
Full time student	12.2	11.6	11.9
Not working	5.3	16.1	10.9
Other	0.1	1.2	0.7
Total Percent	100	100	100
Total Individuals	452,744	489,047	941,791

The results from the table 5.3 reveal that more than half (52.5 percent) of the population aged 15 years and above attained Form 1- 4 education level. Both employed and unemployed population recorded the higher number of persons who had Form 1- 4 education (47.5 and 62.8 percent respectively). The same level is observed for the inactive population with 59.1 percent.

Table 5.3 Percentage of Population Aged 15 Years and Above and Main Activity in Last 7 Days by Level of Education, HBS 2019/20

Education level	Employed	Unemployed	Inactive	Total

Total Individuals	577,751	125,201	238,839	941,791

5.1.4 Employed Population by Occupation and Monthly Salary

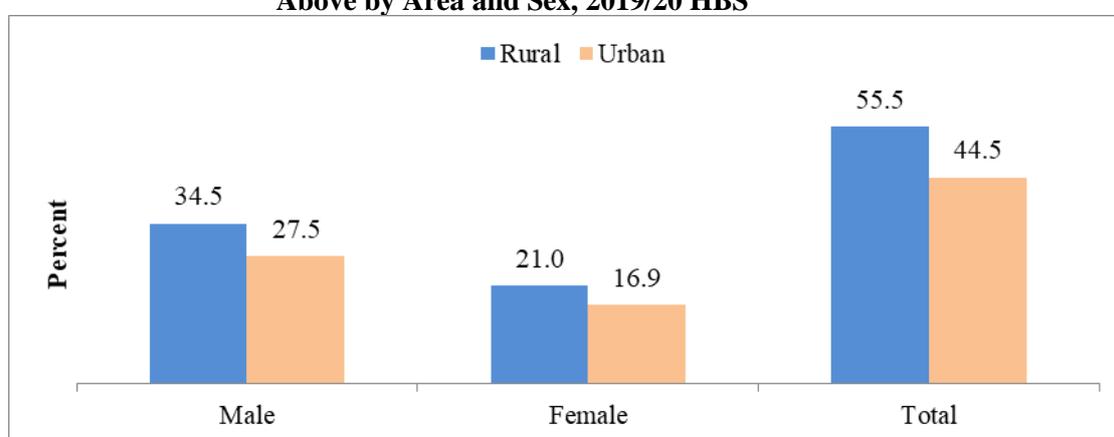

Occupation refers to a person's job (task and duties performed) and includes both full time and part time jobs. It also includes people who are self-employed and paid employees. The finding from the Table 5.4 illustrate that most of the employed people were subsistence farmers, fishers or hunters (under the category of skilled agriculture and fishery). These occupations were found to be 29.0 percent of the total employed persons aged 15 and above in the last seven days. The second largest occupation fell under the group of elementary occupation with 22.7 percent of the total employees, which is very close to the service and shop sales workers with 21.4 percent of employees. The last occupation was managing directors, chief executives, legislators and senior officials with 1.2 percent (Table 5.4). **Table 5. 4:**

Table 5.4: Percentage of Currently Employed Population Aged 15 years and above and Main Occupation by Area and Sex, HBS 2019/20

Occupation	Rural			Urban			Total		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
Legislators, administrators and managers	0.9	0.2	0.6	2.4	1.2	1.9	1.6	0.6	1.2
Professionals	1.5	1.2	1.4	4.9	5.0	5.0	3.0	2.8	2.9
Technicians and Associate Professionals	4.1	3.8	4.0	5.6	10.0	7.4	4.8	6.3	5.4
Clerks	0.9	1.1	1.0	2.9	4.4	3.5	1.8	2.4	2.1
Service Workers and Shop Sales Workers	12.1	14.0	12.9	28.8	39.0	32.9	19.4	24.3	21.4
Skilled Agricultural and Fishery Workers	46.3	44.3	45.5	8.8	3.5	6.7	29.9	27.6	29.0
Craft and Related Workers	10.5	9.5	10.1	22.1	11.3	17.8	15.6	10.2	13.4
Plant and Machine Operators and Assemblers	2.9	0.2	1.8	3.9	0.1	2.4	3.3	0.2	2.0
Elementary Occupations	20.7	25.6	22.8	20.6	25.5	22.5	20.6	25.6	22.7
Total percent	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Total Number	190,906	140,952	331,857	147,772	98,122	245,894	338,678	239,074	577,751

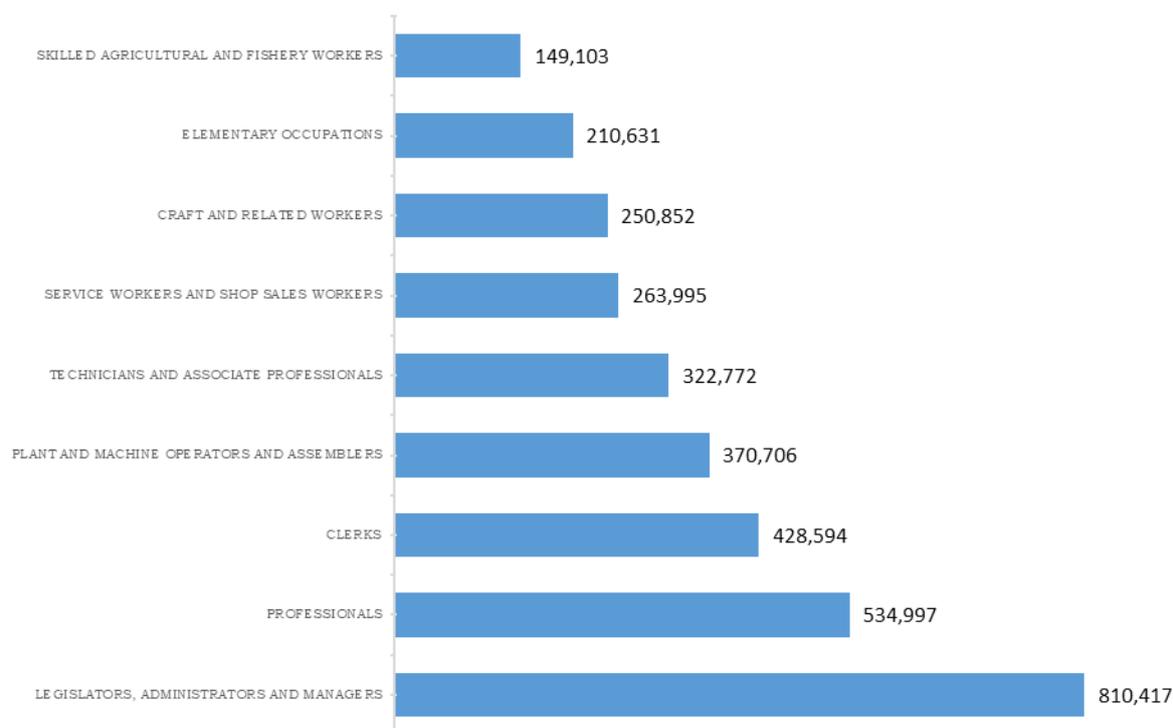

Figure 5.2 reveals that majority of the currently employed population was found in the rural areas (55.5 percent) compared with the urban areas (44.5 percent). For sex differential, both the rural and urban areas had higher proportions of male employees than female employees.

Figure 5. 2 Figure 5. 2: Percentage of Currently Employed Population Aged 15 Years and Above by Area and Sex, 2019/20 HBS

The data from the 2019/2020 HBS (Figure 5.3) shows that the average salary levels are higher for jobs requiring more qualifications. The overall average monthly salary is TZS 240,024 whereby the monthly salary of Legislators, administrators and managers (TZS 810,417) was the highest compared to other occupations. The subsistence farmer, which was included under the category of skilled agriculture and fishery, had the least amount of salary (TZS 149,103) whereas elementary occupation earned an average of TZS 210,631 per month.

Figure 5. 3 Average Monthly Salary by Occupation, 2019/20 HBS

5.1.5 Employed Persons by Industry

Agriculture, forestry and fishing is the industry that engages the most of the employed persons (36.2 percent). There is no difference between the percentage of males and females working in the agricultural industry. The next industry observed to have more employed persons was wholesale and retail trade and repair of motor vehicles and motorcycles, which engaged 16.2 percent of total employed persons.

Geographically, in rural areas, more than a half (56.2 percent) of people were engaged in agriculture, where the proportion of females is higher (57.5 percent) than males (55.2 percent). In urban areas, however, about one-quarter of the people (25.7 percent) were engaged in the wholesale and retail trade and repair of motor vehicles and motorcycles, with only 9.1 percent engaged in agriculture, forestry or fishing.

Table 5.5: Percentage of Currently Employed Population Aged 15 Years and Above and Main Industry by Area and Sex, 2019/20 HBS

Industry	Rural			Urban			Total		
	Male	Female	Total	Male	Female	Total	Male	Female	Total

5.1.6 Employed Persons by Employment Status

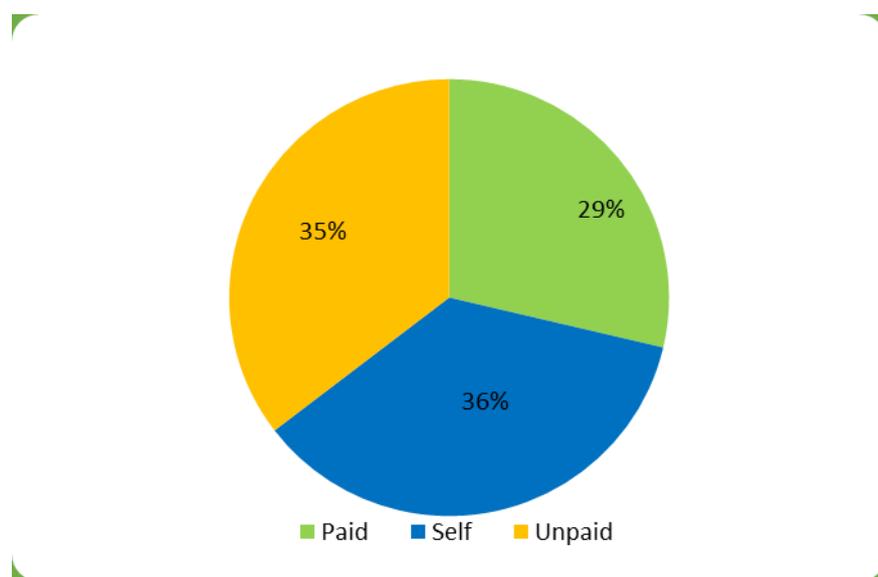

The results from Table 5.6 show that nearly one-third of the employed persons were engaged as unpaid family workers in agriculture (32.9 percent), followed by self-employed non agriculture without employees (32 percent), with the lowest being persons engaged in their own farms or shamba/family (0.8 percent). About half of the employed persons (51.9 percent) in rural areas were unpaid family workers in agriculture. More males were engaged in paid employment than females, whereas more females were engaged as self-employed without employees than males.

Table 5. 6 Percentage of Currently Employed Population Aged 15 Years and Above and Employment Status by Area and Sex, 2019/20 HBS

Employment	Rural			Urban			Total		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
A paid employee	22.4	10.7	17.5	45.7	41.0	43.8	32.6	23.1	28.7
A self-employed (non-agriculture) with employees	4.5	1.7	3.3	5.8	2.9	4.7	5.1	2.2	3.9
A self-employed (non-agriculture) without employees	21.0	29.7	24.7	37.6	48.5	41.9	28.2	37.4	32.0
Unpaid family workers (non-agriculture)	0.6	2.6	1.4	1.3	3.0	2.0	0.9	2.7	1.7
Unpaid family workers (agriculture)	50.6	53.6	51.9	9.2	4.3	7.3	32.6	33.4	32.9
Work on own farm or shamba/family	0.9	1.7	1.2	0.4	0.3	0.4	0.6	1.1	0.8
Total percent	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0
Total	190,906	140,952	331,857	147,772	98,122	245,894	338,678	239,074	577,751

Figure 5.4 shows the distribution of persons by their employment status in broad group categories. The discrepancy between self-employed (35.9 percent) and unpaid family workers (35.4 percent) is very marginal while paid employees account for 28.7 percent of the total employees.

Figure 5. 4 Percentage of Currently Employed Population Aged 15 Years and Above and Main Employment Status by Area and Sex, 2019/20 HBS

5.1.7 Unemployed Persons

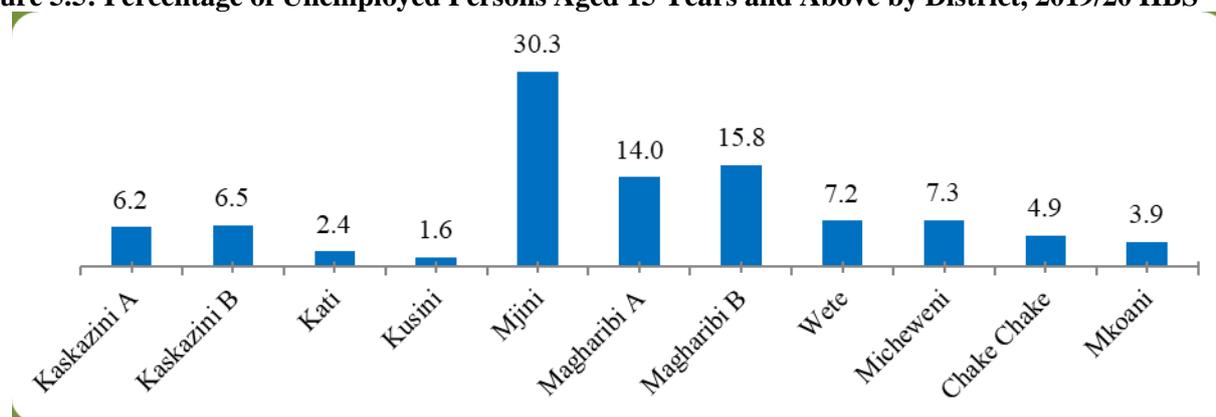

Table 5.7 shows that overall, 7.7 percent of persons aged 15 years and above are unemployed and majority of the unemployed persons were found in the urban areas (10.7 percent) than in the rural areas (5.3 percent). In terms of age, the younger age groups (15-34) seemed to have higher figures for both rural and urban areas. There is a marked variation between the two sexes in all age groups where more females reported to be unemployed than males.

Table 5. 7 Percentage of Individuals Aged 15 and Above who Classify Themselves as Unemployed by Age Group, Sex and Area, 2019/20 HBS

Area/Sex	Age 15-24	Age 25-34	Age 35-64	Age 65+	Total
Rural	16.2	13.6	3.3	3.1	5.3
Urban	24.0	21.9	10.1	3.2	10.7
Total	20.0	17.6	6.5	3.1	7.7
Male	15.5	6.6	1.3	2.9	4.2
Female	24.5	25.9	11.6	3.4	11.0
Total	20.0	17.6	6.5	3.1	7.7
Total Individuals	62,880	36,885	23,731	1,706	125,201

The distribution of unemployed persons as highlighted in Figure 5.5 shows that Mjini district has the highest proportion of unemployed persons (30.3 percent) while Kusini has the lowest proportion (1.6 percent).

Figure 5.5: Percentage of Unemployed Persons Aged 15 Years and Above by District, 2019/20 HBS

5.2 AGRICULTURAL ACTIVITIES

5.2.1 Proportion of Households Owning and Using Land

The HBS 2019/20 asked households whether they had land for agriculture activities during 2017/2018 agricultural year (1st of October, 2017 to 30th of September, 2018). The result in Table 5.8 shows that from the total households of 292,796, 34.6 percent of them owned land for agriculture. Land owned for agriculture is much more prevalent in rural areas (47.9 percent) compared with 16.4 percent in urban areas.

Table 5.8: Percentage of Households Owned Land for Agriculture during 2017/18 Agricultural Year

Whether had own land 2013/14	Rural	Urban	Total
Yes	47.9	16.4	34.6
No	52.1	83.6	65.4
Total Percent	100	100	100
Total Households	169,461	123,335	292,796

Households owning land for agriculture activities was recorded in all districts, with the largest proportion in Mkoani district with 13.3 percent, followed by Kaskazini A district with 12.5 percent and 11.4 percent in Wete district. The district with the smallest proportion of households owning land for agriculture activities was Mjini district with only 3.5 percent (Figure 5.6).

Figure 5.6: Percentage Distribution of Households Owning Land for Agriculture by District, 2019/20 HBS

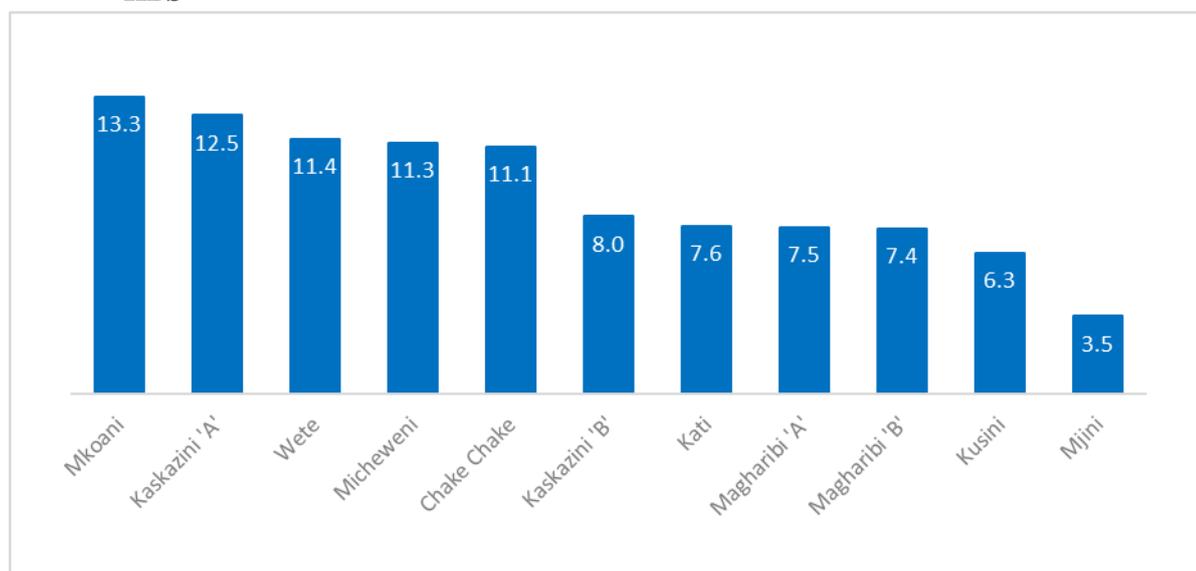

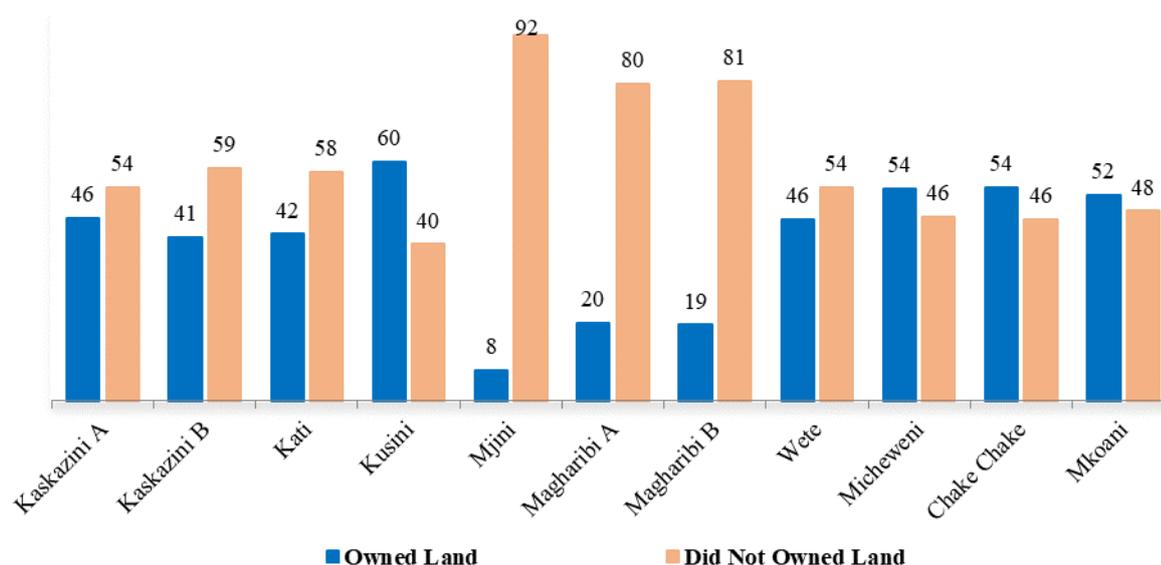

Figure 5.7 show the proportion of households that owned and did not own land for agriculture activities during 2017/2018 agriculture year, aggregated by district. The results reveal that 54 percent from the total households within the Micheweni district (21,394) owned land for agriculture activities. Similar result was observed for Chake Chake and Mkoani districts with 54 and 52 percent of the total households within the districts respectively. The Mjini district with only 8 percent, Magharibi A (20 percent) and Magharibi B (19 percent) were the district with the lowest proportion of households owning land for agricultural activities.

Figure 5.7: Percentage of Households Owned Land for Agriculture by District, 2019/20 HBS

The findings from table 5.9 show the proportion of land used for agriculture by district and average holding size of the land used. The results reveal that from the total land reported to be used for agricultural activities (160,373 Acre), Mkoani district used 17.7 percent which is the largest, followed by Wete district with 11.6 percent, with the smallest proportion observed in Mjini district with only 4.4 percent of the total agricultural land used.

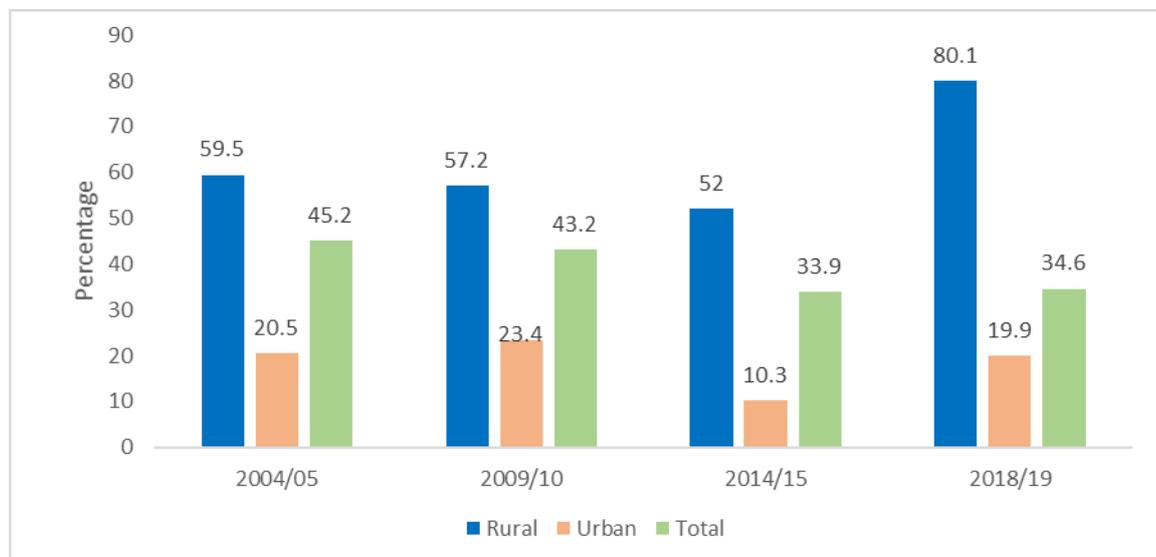

Table 5.9: Percentage of Households Owned Land and Percentage of Area Used by District and Holding Size during 2017/18 Agricultural Year

District	%Households	%Area	Holding Size (Acre)
Kaskazini A	12.4	11.3	1.4
Kaskazini B	8.0	7.9	1.6
Kati	7.6	11.0	2.3
Kusini	6.4	5.4	1.3
Mjini	3.5	4.4	2.0
Magharibi 'A'	7.5	4.9	1.0
Magharibi 'B'	7.4	7.8	1.7
Wete	11.5	11.6	1.6
Micheweni	11.3	7.6	1.1
Chake Chake	11.1	10.3	1.5
Mkoani	13.4	17.7	2.1
Total Percent	100.0	100.0	
Total	101,344	160,373	1.6

The results further show that at the national level, the average holding size of land used for agriculture per household was 1.6 acre. At the district level however, there was a marginal difference in the holding size of land used for agriculture across the districts. Kati district had the highest average holding size of the land used for agriculture which is 2.3 acre per household, followed by Mkoani district with 2.1 acre, and Mjini district with 2.0 acre. The lowest holding size of land used for agriculture was observed in Magharibi A district with 1.0 acre per household (Table 5.9).

Figure 5.8 shows the proportion of households that owned land for agriculture during agricultural year 2017/2018 and area. The result reveals that at the national level, one third of the households (34.6 percent) own agricultural land, with more households in the rural areas owning agricultural land (80.1 percent) than in the urban areas (19.9 percent). The trend shows that the proportion of the total households' ownership of agricultural lands increased by 2.1 percentage points in 2019/20 HBS from their 2014/15 value.

Figure 5.8: Percentage of Households Owned Land for Agriculture by Area, 2019/20 HBS

The results in table 5.10 show that in total, only 6.8 percent of households that reported to have owned land for agricultural activities owned four or more acres, which was a decline from the 11.5 percent in the 2014/15 HBS. About 57 percent of households have a small plot of less than one acre which represented an increase from the 25.8 percent recorded in the 2014/15 HBS. The result further indicates that 14.8 percent of the households that own land have plot size ranging from 2 to 2.9 acre which was less in comparison with the 2014/15 HBS.

On average, the majority of the households (57.3 percent) had less than one acres of land for agricultural purposes in 2019/20 HBS compared with 25.8 percent in 2014/15 HBS. This indicates that ownership of agricultural land has decreased over years.

Table 5.10: Percentage of Households Owned Land for Agricultural Activities by Plot size and Area, 2014/15 and 2018/19 HBS

Size of plot	Rural		Urban		Total	
	2014/15	2019/20	2014/15	2019/20	2014/15	2019/20
Less than 1 acre	25.0	57.0	31.1	58.4	25.8	57.3
1.0-1.9 acres	33.7	11.2	34.6	4.9	33.8	9.9
2.0-2.9 acres	21.0	15.4	15.3	12.6	20.3	14.8
3.0-3.9 acres	9.2	9.9	4.5	16.0	8.6	11.2
4+ acres	11.0	6.5	14.4	8.1	11.5	6.8
Total Percent	100	100	100	100	100	100
Total Households	81,152	81,135	12,693	20,209	93,845	101,344

5.2.2 Agricultural Tools and Livestock Assets

Table 5.11 shows households' ownership of various agricultural assets. Ownership of these assets is more widespread in rural areas than in urban areas. In rural areas, for instance, the ownership of various agricultural assets account 64.3 percent compared with 35.7 percent in urban areas.

Table 5.11: Percentage of Households and Ownership of Agricultural Assets by Area 2019/20 HBS

Asset	Rural	Urban	Total
Cart	88.0	12.0	33.0
Harrow	0	0	0
Hoe	60.0	40.0	41.2
Plough	0	0	0
Tractor	0	0	0
Trailer	0	0	0
Wheel borrow	39.6	60.4	17.3
Water Pump	41.1	58.9	20.0
Total Households	15,808	8,784	24,592
Percentage	64.3	35.7	100

Table 5.12 shows the percentage of agricultural asset used for agriculture in 2019/2020 HBS. From the total assets used by the households, 88.0 percent (177,844) are other equipment such sickle, hand spike, rakes etc. The remaining assets that are Ox cart 3.6 percent (7,303), wheel barrow 2.1 percent (4,266), with seedling machines 0.1 percent (173) being the assets least used by the households. Although some agricultural households used tractors and their implements, all of these tractors and their associated implements were hired from the government.

Table 5.12: Percentage Distribution of Number of Assets used for Agriculture by District, 2019/2020, HBS

Percentage	3.6	2.1	2.4	0.1	0.5	88	3.2	9	100

5.2.3 Livestock

Table 5.13 shows the livestock and poultry population from the 2019/20 HBS. The results reveal that cattle was the most dominant livestock accounting for about 74 percent (166,047) of the total livestock (cattle, goats and sheep), followed by goats 24.8 percent (55,575), with sheep being the least 1.2 percent (2,769).

The Table 5.13 further shows that there was 2,903,221 poultry population as of 1st October 2018. Of these, indigenous chicken constituted 71.5 percent (2,076,770), broiler 3.7 percent (106,735), layers 21.8 percent (632,364), and other birds accounting for only three percent of the total poultry population.

Table 5.13: Number of Livestock by Type and Household, 2014/15 HBS

Livestock Type/ Poultry	Number of Household	Number of Livestock/Poultry	Number per Household
Cattle	105,476	166,047	2
Goats	24,331	55,575	2
Sheep	610	2,769	5
Pigs	0	0	0
Total Livestock		224,391	
Indigenous Chicken	114,875	2,076,770	18
Broilers	1,202	106,735	89
Layers	2,455	632,364	258
Donkey	0	0.0	0
Other Poultry	11,867	87,352	7
Total Poultry		2,903,221	

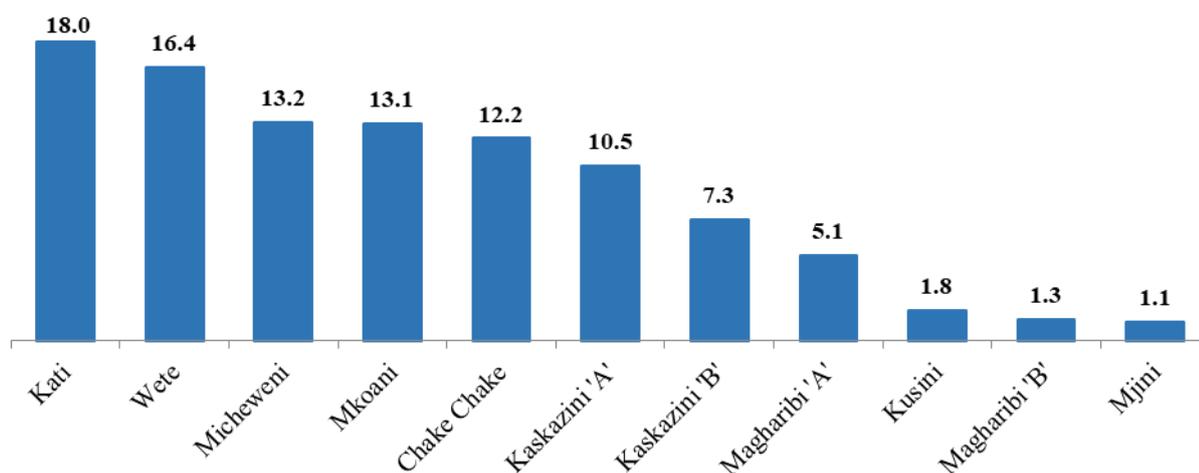

Table 5.14 shows the percentage of households and percentage of cattle by herd size. The herd size of cattle per holding is 2 herds from the 2019/20 HBS. However, from the total 105,476 cattle keeping households, 98.5 percent reared between 1 and 5 herds with an average of one cattle per household. One percent of the households reared between 6 and 10 cattle with average of 7 herds per household, while only 0.1 percent of the cattle keeping households reared between 16 to 20 herds with average of 18 herds per household. However, cattle population in this category account for only one percent of the total cattle population (Table 5.14).

Table 5.14: Percentage of Households and Percentage of Cattle by Herd Size, HBS 2019/20

Herd size	%Households	%Herd of Cattle	Average per Household
1 - 5	98.5	91.6	1
6 - 10	1.1	5.2	7
11 - 15	0.3	2.2	13
16 - 20	0.1	1	18
Total Percent	100	100	
Total Households	105,476	166,047	2

Figure 5.9 below shows the percentage distribution of cattle by district. Kati district accounted for 18 percent of the total cattle population in Zanzibar, followed by Wete district with 16.4 percent, Micheweni district with 13.2 percent, and the lowest percentage was recorded in Mjini district with only 1.1 percent of the total cattle population.

Figure 5.9: Percentage of Cattle Distribution by District, 2018/19 HBS

5.2.4 Goat Population

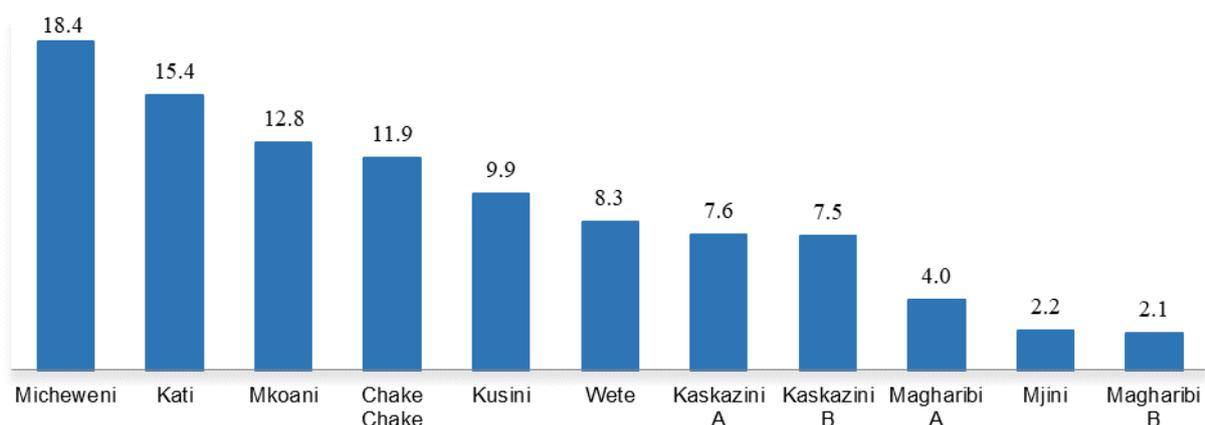

Table 5.15 show the percentage of households and percentage of goat by herd size. On average, the herd size of goat per holding is 2 herds. However, from the total 24,331 goats keeping households, 96.2 percent reared between 1 and 5 herds with average of two herds per household. Three percent of the households reared between 6 and 10 goats with average of 7 herds per household while only 0.2 percent of the goat keeping households reared between 16 to 20 herds with average of 17 herds per household.

Table 5.15: Percentage of Households and Percentage of Goat by Herd Size, HBS 2018/2019

Herd size	% of Households	% Herd of goats	Average per Household
1 - 5	96.2	86.7	2
6 - 10	3.1	9.1	7
11 - 15	0.4	2.5	14
16 - 20	0.2	1.7	17
Total Percent	100	100	
Total Households	24,331	55,575	2

Figure 5.10 shows the percentage distribution of goats by district. The Micheweni district accounted for 18.4 percent of the total goat population in Zanzibar, followed by Kati district with 15.4 percent, Mkoani district with 12.8 percent, with the least percentage recorded in Magharibi B district with only 2.1 percent of the total goat population.

Figure 5.10: Percentage of Cattle Distribution by District, 2018/19 HBS

5.2.5 Sheep Population

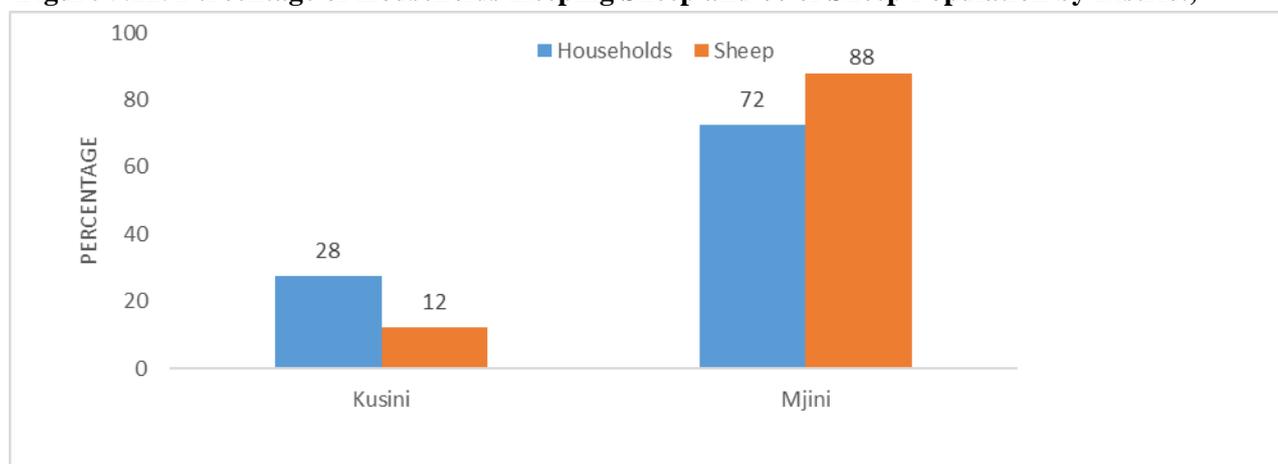

Sheep keeping is insignificant in Zanzibar with only 610 households engaged in sheep rearing with only 2,769 herds. Table 5.16 shows the percentage of households and percentage of sheep by herd size. On average, the herd size of sheep per holding is 5 herds. However, from the total of 610 sheep keeping households, 63.8 percent reared between 1 and 5 herds with average of 4 herds per household. The remaining 36.2 percent of the households reared between 6 and 10 sheep with average of 6 herds per household.

Table 5.16: Percentage of Households and Percentage of Sheep by Herd Size, HBS 2018/2019

Herd size	%Households	% Herd of Sheep	Average per Household
1 - 5	63.8	52.0	4
6 - 10	36.2	48.0	6
Total Percent	100	100	
Total Households	610	2,769	5

Figure 5.11 shows the percentage of households keeping sheep and percentage of sheep population by district. The results reveal that Mjini district accounted for 88 percent of the total sheep population with 72 percent of the total households keeping sheep. The second district is Kusini of which 12 percent of the total sheep population was kept by about 28 percent of the total households reported to be keeping sheep.

Figure 5.11: Percentage of Households Keeping Sheep and % of Sheep Population by District,

5.2.6 Chicken Population

Table 5.17 show the percentage of households and percentage of chicken by flock size. The result reveals that many households in Zanzibar keep chicken, especially indigenous chicken. There were a total of 118,156 households that kept 2,815,869 chickens of which 74 percent were indigenous, 22 percent were layers and 4 percent were broilers. On average, each household kept 24 birds per household. However, from the total 118,156 chicken keeping households, 96.9 percent kept between 1 and 49 birds with average of six birds per household. About 1.3 percent of the households reared between 100 and 299 birds with average of 156 birds per household while only 0.2 percent of the chicken keeping households reared 1000+ birds with average of 4496 birds per household.

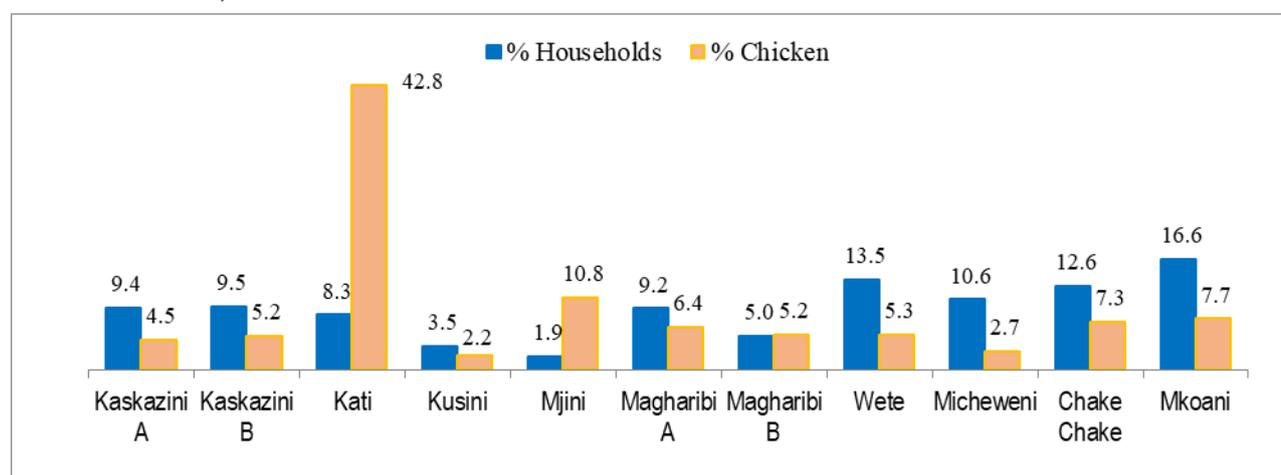

Table 5. 17: Percentage of Households Keeping Chicken and Percentage of Chicken by Flock Size, HBS 2019/20

Flock Size	Percentage of Households	Percentage of Chicken	Average per Household
1-49	96.9	32.4	8
50 - 99	0.9	2.3	60
100 - 299	1.3	8.5	156
300 - 499	0.3	4.8	336
500 -999	0.3	5.9	549
1000+	0.2	46.1	4,496
Percentage	100	100	
Total	118,156	2,815,869	24

The result in the Table 5.17 further reveals that 46.1 percent of the total chicken population were kept by only 0.2 percent of the chicken rearing households, followed by 32.4 percent of the chicken population being kept by 96.6 percent of the chicken rearing households.

Figure 5.12 show the percentage of households keeping chicken and percentage of chicken population by district. The results reveal that Kati district accounted for 42.8 percent of the total chicken population with 8.3 percent of the total households keeping chicken. This was followed by Mjini district with 10.8 percent of the chicken population being kept by 1.9 percent of the households. Furthermore, the district with the least number of chickens recorded was Kusini with 2.2 percent of the total chicken population being reared by 3.5 percent of the households involved in keeping chicken.

Figure 5.12: Percentage of Households Keeping Chicken and Percentage of Chicken Population by District, HBS

2019/20

5.2.7 Livestock Products

A total of 11,336,468 litres of cow milk was produced from indigenous and improved dairy cattle from the 2019/2020 HBS. Indigenous cattle produced 7,341,992 litres which represent 65 percent of the total production while improved dairy cattle produced 3,994,476 litres which is equivalent to 35 percent of the total production. The larger production of cow milk was reported in Mkoani district with 2,784,35 litres representing 24.6 percent of the total production, followed by Kati district with 2,418,191 litres equivalent to 21.3 percent, and the least amount of cow milk production was reported in Kusini district with 0.4 percent of the total production (Table 5.18).

Table 5.18: Total Milk Production by Cattle Type and District, HBS 2019/2020

District	Indigenous cattle Milk Production (Litres)	Improved Dairy Cattle Milk Production (Litres)	Total Milk Production (Litres)	Percentage
Kaskazini A	397,224	-	397,224	3.5
Kaskazini B	518,086	-	518,086	4.6
Kati	1,499,014	919,176	2,418,191	21.3
Kusini	41,971		41,971	0.4
Mjini	19,627	199,024	218,651	1.9
Magharibi A	522,199	335,840	858,039	7.6
Magharibi B	143,570	29,708	173,278	1.5
Wete	1,047,987	435,254	1,483,241	13.1
Micheweni	689,624	233,314	922,937	8.1
Chake Chake	920,345	600,160	1,520,505	13.4
Mkoani	1,542,345	1,242,000	2,784,345	24.6
Total	7,341,992	3,994,476	11,336,468	100.0
Percentage	65.0	35.0	100	

The average price of milk varied between indigenous cattle and improved dairy cattle. The average price of milk for indigenous cattle per litre was TZS 1,200.00 while the average price for improved dairy was slightly higher than indigenous cattle at TZS 1,317.00 per litre (Table 5.19).

Table 5.19: Total Milk Production by Cattle Type with Average Price, HBS 2019/2020

Cattle Type	Total production (Litres)	Total Sold Milk (Litres)	Total Value (TZS)	Average Price/Litre (TZS)
Indigenous Cattle	7,341,992	2,922,171	3,505,293,922	1,200
Improved Dairy	3,994,476	2,740,079	3,609,409,709	1,317
Total	11,336,468	5,662,249	7,114,703,632	1,257

5.2.8 Eggs Production

A total of 113,867,115 eggs were produced from indigenous chicken and Layers from the 2019/2020 HBS. Indigenous chicken produced 35,801,251 eggs which represent 31 percent of the total production while Layers produced 78,065,864 eggs equivalent to 69 percent of the total production. From the total eggs production, 60 percent were sold with average price of TZS 359 per egg for indigenous chicken and TZS 207 per egg for Layers, while 40 percent of the produced eggs were consumed by household members. In general, less than half of the total eggs from indigenous chicken was sold compared to about 95 percent of the total eggs from Layers being sold (Table 5.20).

Table 5.20: Total Eggs Production with Average Price by Chicken Type, 2019/20 HBS

Chicken Type	Total production (Pieces)	Total Eggs Sold (Pieces)	Total Value (TZS)	Average Price/Piece
Indigenous chicken	35,801,251	344,144	123564701.2	359
Layer	78,065,864	67,914,469	14044986976	207
Total	113,867,115	68,258,613	14,168,551,678	208
Percent		60.0		

5.2.9 Sex of Decision Maker on Income from Agriculture

The results in Table 5.21 show that from the total households of 149,817 that reported to receive income from sales of agriculture crops, 58.1 percent of these households reported that the decision for spending the income comes from a male, followed by the decision coming from a female (23.6 percent), and both sexes making the decision accounting for only 18.3 percent. The results further show that from the total households of 94,036 that reported to have received income from livestock activities, 54.5 percent of these households reported that the decision for spending the income came from a male, followed by the decision coming from a female (25.4 percent), and both sexes making the decision accounting for only 20.1 percent.

Table 5.21: Percentage of Households Who Own Land and Livestock and Who Makes Final Decision on Spending Household Income from Agriculture by Area, 2014/15 and 2018/19 HBS

CHAPTER SIX: HOUSEHOLD CONSUMPTION AND EXPENDITURE

6.1 Introduction

This chapter examines the levels of households' per capita expenditure and consumption from the 2019/20 HBS. Comparison between 2019/20, 2014/15 and 2009/10 HBS are also made in order to provide a trend analysis of the consumption pattern of the population. This is done in two ways. In section 6.2, comparisons are made between 2009/10, 2014/15 and 2019/20 using the old methodology applied in the 2009/10 HBS report. In summary, the consumption indicator previously included amounts for durable goods, imputed rent and expenditure on ceremonies such as weddings and funerals. However, the trends shown in section 6.4 compare the three HBSs but apply the new methodology – which excludes amounts for durable goods, imputed rent and the cost of weddings and funerals.

The structure of consumption provided in this chapter is useful for the weights for Consumer Price Index. A detailed description of how expenditure is captured on HBS can be found in Annex A3. The complete list of the 596 COICOP items identified in HBS 2019/19 is shown in Annex D.

6.2 Trends in Average Consumption Levels using the Old Methodology

Table 6.1 reports the mean and median household total expenditure and per capita expenditure over one month in 2019/20 prices. There is an increase in both mean and median total household expenditure. The mean total household expenditure increased from TZS 260,815 in 2009/10 to TZS 654,189 in 2019/20. The median total household expenditure over this period also increased from TZS 215,307 to TZS 539,780. Both the mean and the median per capita expenditure also increased over this period. Urban households enjoyed higher consumption during the three survey periods. In all cases, the mean values are higher than the median values, suggesting some high outlying values for a few households.

Table 6. 1 Average Monthly Household Expenditure by Area: 2009/10, 2014/15 and 2019/20 HBS

Area	Average Monthly Household Expenditure						Average Monthly Household Expenditure per capita					
	2009/10	2014/15	2019/20	2009/10	2014/15	2019/20	2009/10	2014/15	2019/20	2009/10	2014/15	2019/20
	Mean			Median			Mean			Median		
Rural	202,095	346,701	532,933	180,921	302,841	453,749	37,682	62,802	87,592	32,393	52,994	73,022
Urban	346,462	504,460	807,328	289,766	421,627	686,181	61,164	90,083	135,373	49,763	71,938	109,849
Total	260,815	414,991	654,189	215,307	350,804	539,780	47,544	74,707	108,707	37,910	60,173	88,464

Table 6.2 reports the average household expenditure per district from the 2019/20 HBS. There is notable variation in both total household expenditure and per capita expenditure across the districts. The results reveal that the newly-created Magharibi B district had both the highest average total monthly expenditure (TZS 947,473) and the total expenditure per capita (TZS 159,139). All the districts enjoyed an increase in their per capita expenditure over the three survey periods. Micheweni remains the district with the lowest per capita expenditure, despite some notable increments across the survey periods from TZS 28,891 in 2009/10 to TZS 68,471 in 2019/20. With the exception of the per capita expenditure values for the newly-created Magharibi A and Magharibi B, the Kusini district enjoyed the largest increase in per capita expenditure between 2009/10 and the 2019/20 survey periods.

Table 6. 2 Monthly Average Household Expenditure by District 2009/10, 2014/15 and 2019/20 HBS

District	Average Total Monthly Expenditure						Average Total Expenditure per capita					
	2009/10	2014/15	2019/20	2009/10	2014/15	2019/20	2009/10	2014/15	2019/20	2009/10	2014/15	2019/20

Total	260,815	414,991	654,189	215,307	350,804	539,780	47,544	74,707	108,707	37,910	60,173	88,464

The average expenditure per capita and quintile by district can be found in Table B6.1 in Annex B.

6.3 Examining the Type of Expenditure, Old Methodology

Table 6.3 presents the mean per capita expenditure of different groups of items by area. The items are grouped according to the UN system of Classification of Individual Consumption by Purpose (COICOP). The data shows that the share of expenditure on food has dropped from 52.1 percent in 2009/10 to 41.4 percent in 2019/20 while the share of expenditure on several non-food categories (transportation, Miscellaneous Goods & Services etc.) has increased.

Table 6. 3 Mean Per Capita Expenditure and Category of Item by Area, 2009/10, 2014/15 and 2019/20 HBS

COICOP Category	2009/10			2014/15			2019/20		
	Rural	Urban	Total	Rural	Urban	Total	Rural	Urban	Total

Total Percent	100	100	100	100	100	100	100.0	100.0	100.0

The distribution of expenditure shares by five quintiles, with 1 being the poorest 20% of households and 5 being the richest, is presented in Table 6.4. As expected, the share of expenditure on food declines as households get richer while the share of expenditure on recreation, hotels, restaurants rises with income.

Table 6. 4 Share of Expenditure and COICOP Category by Quintile, 2009/10, 2019/20

COICOP	1	2	3	4	5	Total

6.4 Trends in Average Consumption Levels using the New Methodology

The mean and median household total expenditure and per capita expenditure over one month in 2019/20 prices are presented in Table 6.5, based on the new methodology. The new methodology excludes expenditure on imputed rent, household durables and costs for weddings and funerals. The rental market in Zanzibar is limited. For instance, in urban areas only 12.0 percent of the HBS 2019/20 households reported renting their accommodation and in the rural areas, the rental market is virtually non-existent with only 1.7 percent of the HBS households renting their home. Therefore, it was decided not to impute a value for rent as the final consumption amount would not realistically reflect an actual amount in money terms that could be used for consumption by households as, by and large, there is no rental market in Zanzibar. This explains why the consumption values generated using the new methodology are lower compared to those generated using the old methodology.

Using the new methodology, the mean total household expenditure increased from TZS 230,346 in 2009/10 to TZS 499,793 in 2019/20. The median total household expenditure over this period also increased from TZS 191,131 to TZS 421,058 (see Table 6.5). Both the mean and median per capita expenditure also increased over this period. Urban households enjoyed higher consumption over the three survey periods in relation to their rural counterparts. In all cases, the mean values are higher than the median values, suggesting some high outlying values for a few households.

Table 6. 5 Average Monthly Household Expenditure by Area: 2009/10, 2014/15 and 2019/20 HBS

Area	Average Monthly Household Expenditure						Average Monthly Household Expenditure per capita					
	2009/10	2014/15	2019/20	2009/10	2014/15	2019/20	2009/10	2014/15	2019/20	2009/10	2014/15	2019/20
	Mean			Median			Mean			Median

6.5 Examining the Type of Expenditure using the New Methodology

In Table 6.6, the average monthly food and non-food aggregates across the survey periods are presented. The results revealed that the mean and median monthly expenditure for both food and non-food have steadily increased from 2009/10 to 2019/20. Urban areas enjoyed a much higher increase in both food and non-food expenditure compared to the rural areas.

Table 6. 6 Monthly Food and Non-Food Expenditure by Area, 2009/10, 2014/15 and 2019/20 HBS

	2009/10	2014/15	2019/20	2009/10	2014/15	2019/20

6.6 Adult Equivalent Consumption Expenditure

Consumption data are collected at the level of households. For the purpose of poverty and welfare analysis total household consumption needs to be adjusted for differences in household size and composition. This is to account for the fact that, for instance, a single-person household requires less consumption than a household of five. The 2019/20 HBS uses consumption “per adult equivalent” as the key welfare measure for the analysis of poverty. This requires equivalence scales to convert household members of different age and sex into a standardized adult based on assumptions about caloric requirements. Food consumption is further adjusted by the presence days of household members. Price deflators are then used to adjust consumption per adult equivalent for differences in prices across geographic domains and over the course of the HBS fieldwork.

The results in Table 6.7 shows that the adult equivalent consumption increased considerably from TZS 77,646 in 2009/10 to TZS 110,588 in 2019/20. The median adult equivalent consumption also increased across the survey periods. The urban areas had a much higher increase in adult equivalent consumption over the periods compared to the rural areas.

Within the 2009/10 to 2019/20 periods, all the districts enjoyed an increase in their adult equivalent consumption. Apart from the newly-created Magharibi A and Magharibi districts, Kusini had the largest increase in its adult equivalent consumption over the 2009/10 to 2019/20 periods (Table 6.8).

When adult equivalent consumption was disaggregated into quantiles, the results revealed that across the three survey periods, there is an increasing levels of consumption as the quintile increased (Table 6.9). This is also true for both urban and rural areas.

Table 6. 7 Mean and Median Per Equivalent Adult Consumption Expenditure in 2019/20 prices, regionally deflated (New Methodology)

The complete list of all 596 COICOP items captured in HBS 2019/20 and their designated unique COICOP codes can be seen in Annex D1.

CHAPTER SEVEN: INCOME POVERTY AND INEQUALITY

7.1: Introduction

Estimation of national poverty statistics involves three major steps:

- i) Defining a welfare indicator based on income, expenditure or consumption.
- ii) Constructing poverty line thresholds.
- iii) Aggregating the resulting household and poverty status into interpretable population statistics.

Annex A3 describes each of these steps in detail as applied to Zanzibar HBS 2009/10, 2014/15 and 2019/20 data.

The OCGS distinguishes two different poverty concepts – *basic needs poverty* (often simply referred to as poverty) and *food poverty* (often also referred to as extreme poverty). A household is considered ‘basic needs poor’ if its consumption per adult falls below the basic needs poverty line. If consumption per adult also falls below the food poverty line, a household is necessarily consuming less than the minimum food requirement and so is regarded as food poor. By definition, a household that is food poor is also basic needs poor.

Table 7. 1: Food and Basic Needs Poverty Lines (TZS) per Adult Equivalent per Month, 2009/10, 2014/15 and 2019/20 HBS

	2009/10	2014/15	2019/20
Food poverty line	25,364	38,071	47,541
Basic needs poverty line	34,861	53,377	66,313

The 2009/10 poverty lines have been adjusted to match the improved methodology implemented in 2014/15 and 2019/20. The steps involved are clearly described in Annex A3. This chapter examines poverty rates (basic needs and food poverty) by area and district. Changes between 2009/10, 2014/15 and 2019/20 are also examined. Poverty gap statistics and inequality measures are also described.

7.2 Basic Needs Poverty Headcount Rate by Area and District

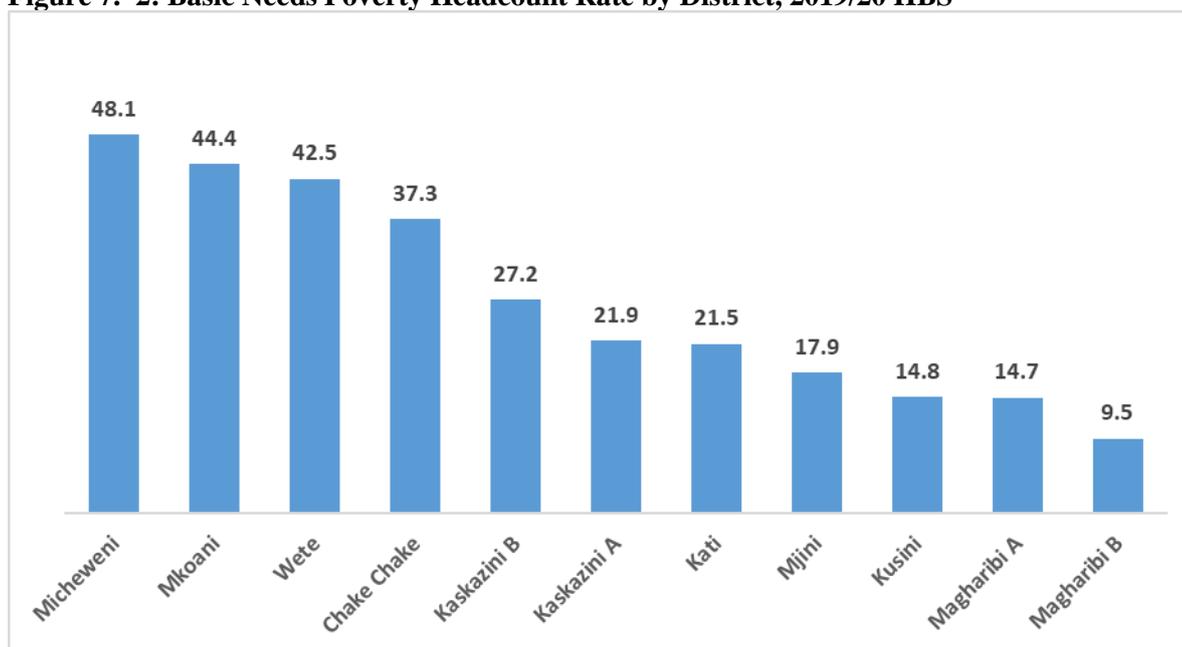

Figure 7.1 shows that basic needs poverty for 2019/20 stands at 25.7 percent. This means 25.7 percent of the Zanzibar population (approximately 417,256 people) is living on less than TZS 66,313 a month. There is a large disparity between urban and rural areas.

Figure 7. 1: Basic Needs Poverty Headcount Rate by Area, 2019/20

In terms of differences between districts, Figure 7.2 shows that there was marked differences between Unguja and Pemba districts, with Pemba districts having a larger proportion of basic needs poor. In relation to differences between districts, these statistics have wide confidence intervals (Annex C) so these results should be quoted with caution.

Figure 7. 2: Basic Needs Poverty Headcount Rate by District, 2019/20 HBS

7.3 Food Poverty Headcount Rate by Area and District

Figure 7.3 shows that food poverty for 2019/20 stands at 9.3 percent. This means 9.3 percent of the Zanzibar population (approximately 150,840 people) is living on less than TZS 47,541 a month. Once again, a large disparity between urban and rural areas can be observed (Figure 7.4). Additionally, considerable differences between Unguja and Pemba districts can be seen from Figure 7.4.

Figure 7. 3: Food (extreme) Poverty Headcount Rate by Area, 2019/2 HBS

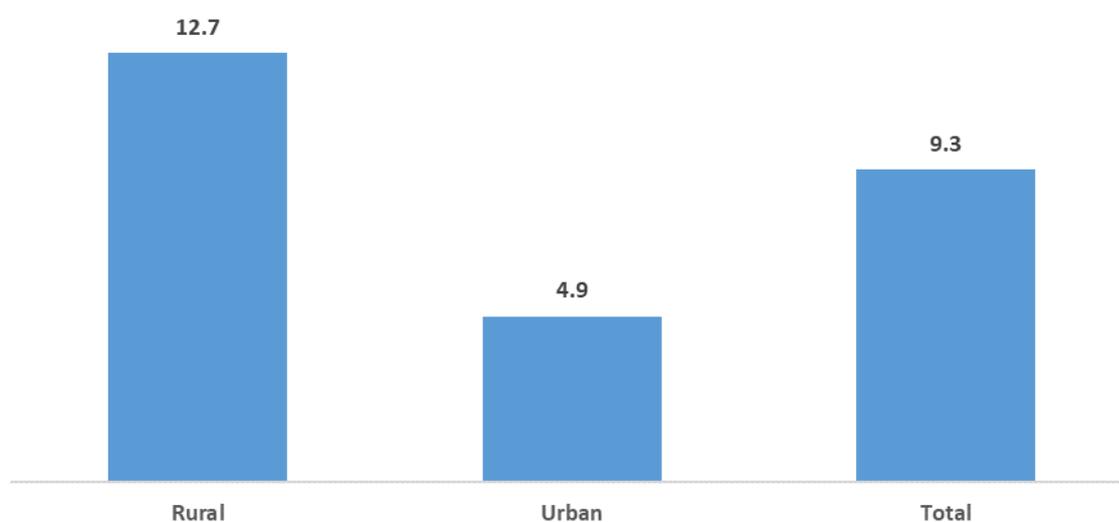

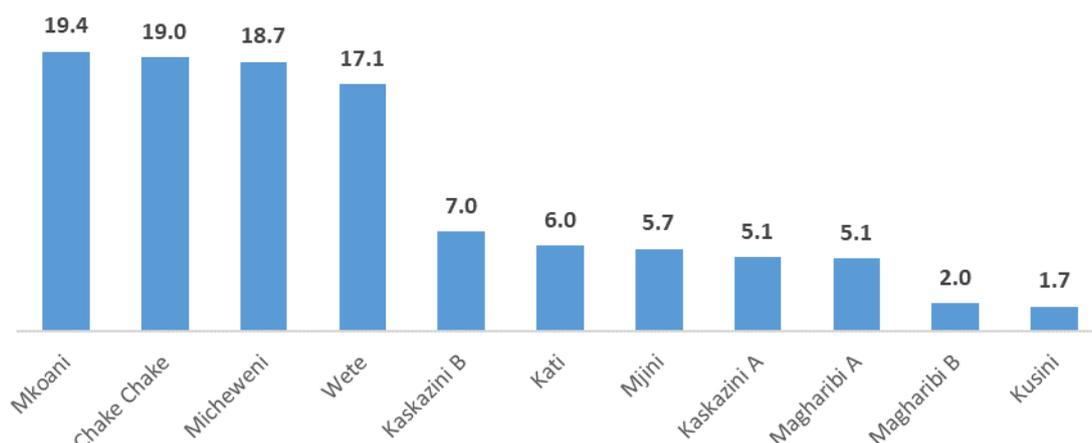

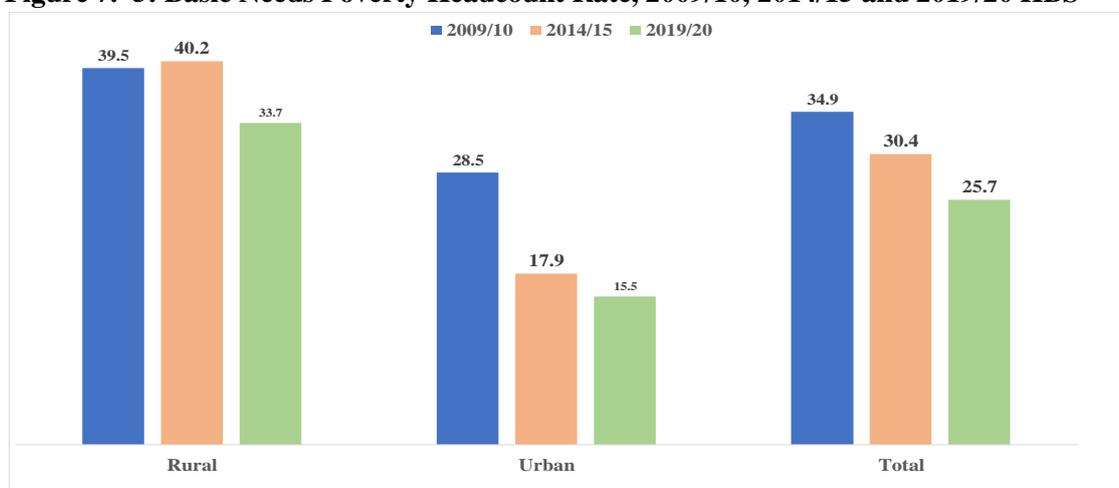

Figure 7. 4: Food (extreme) Poverty Headcount Rate by District, 2019/20 HBS

7.4 Trends in Poverty Reduction

There has been a notable decline in poverty rate over the last 10 years. In 2009/10 for instance, poverty rate was 34.9 but dropped to 25.7 in 2019/20 (Figure 7.5).

Figure 7. 5: Basic Needs Poverty Headcount Rate, 2009/10, 2014/15 and 2019/20 HBS

Although the poverty *rate* has dropped, due to population growth the *actual number* of basic needs poor people have remained virtually similar over the last 10 years (Table 7.2A). The distribution of the basic needs poor people shows that almost three quarters (74.3 percent) of Zanzibar’s basic needs poor population live in rural areas (Table 7.3A).

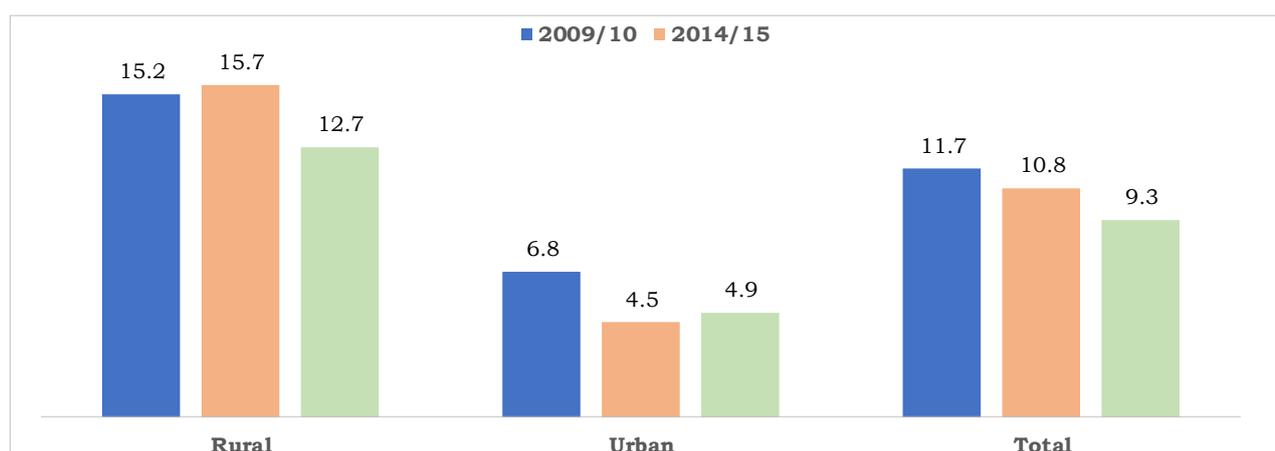

Table 7.2A: Basic Needs Poverty Headcount Rate by Area, 2009/10, 2014/15 and 2019/20 HBS

	2009/10	2014/15	2019/20
Urban	28.5	17.9	15.54
Rural	39.5	40.2	33.69
Total	34.9	30.4	25.67
Total Poor People	443,931	443,540	417,256
Total Population	1,266,910	1,457,025	1,625,589

Table 7.3A: Distribution of the Basic Needs Poor by Area, 2009/10, 2014/15 and 2019/20 HBS

	2009/10	2014/15	2019/20
Urban	34.3	25.7	26.7
Rural	65.7	74.3	73.3
Total Percent	100	100	100
Urban poor population	152,268	113,990	111,608
Rural poor population	291,663	329,550	305,648
Total poor population	443,931	443,540	417,256

The reduction in food poverty rate over the past decade has been rather slow. For instance, food (extreme) poverty rate in 2009/10 was 11.7 percent but dropped to 9.3 percent in 2019/20, which implies a decline of just 2.4 percentage points over the last 10 years.

Figure 7. 6: Figure 7. 5 Food (extreme) Poverty Headcount Rate, 2009/10, 2014/15 and 2019/20 HBS

Due to population growth, the actual number of food poor people has remained largely the same over the last 10 years, despite some notable decline between 2014/15 to 2019/20 (Table 7.2B). Table 7.3B shows that in the rural areas, the proportion of the food poor population has declined from 81.8 percent in 2014/15 to 76.5 percent in 2019/20 while the proportion of the food poor population in urban areas have increased from 18.2 percent to 23.5 percent within the same period.

Table 7.2B: Food Poverty Headcount Rate, 2009/10, 2014/15 and 2019/20 HBS

	2009/10	2014/15	2019/20
Urban	6.8	4.5	4.9
Rural	15.2	15.7	12.7
Total	11.7	10.8	9.3
Total Poor People	149,205	157,133	150,840
Total Population	1,266,910	1,457,025	1,625,589

Table 7.3B: Distribution of the Food Poor, 2009/10, 2014/15 and 2019/20 HBS

	2009/10	2014/15	2019/20
Urban	24.5	18.2	23.5
Rural	75.5	81.8	76.5
Total	100	100	100
Urban poor population	36,555	28,598	35,401
Rural poor population	112,650	128,535	115,439
Total poor population	149,205	157,133	150,840
Total Population	1,266,910	1,457,025	1,625,589

Overall, the reduction in basic needs poverty is driven by area as both rural and urban areas have experienced a noticeable reduction in their basic needs poverty within the periods from 2014/15 to 2019/20. It is worth noting that the reduction in basic needs poverty rate over this period was higher for the rural areas than their urban counterparts (Figure 7.7).

Figure 7. 7: Basic Needs Poverty Headcount Rate by Area, 2009/10, 2014/15 and 2019/20 HBS

In Tables 7.3 and 7.4, the changes in poverty rates by district between 2014/15 and 2019/20 have been presented, even though these changes should be interpreted with caution. This is because as mentioned previously, the confidence intervals associated with the district level poverty rates are wide (Annex C). Generally, the reduction in poverty is more pronounced in Pemba, with Micheweni district in particular, having about 21 percentage points drop in basic needs poverty between 2014/15 to 2019/20 and Chake Chake having about 14.3 percentage points drop within the same period. Overall, the reduction in basic needs (Table 7.3) and food poverty (Table 7.4) seems to have been driven by the districts in Pemba.

Table 7. 3: Basic Needs Poverty Headcount Rate by District, 2014/15 and 2019/20 HBS

7.5 Poverty Gap

Poverty gap is the average shortfall of per adult equivalent consumption in the population relative to the poverty line, which helps to identify the **depth** of poverty. The deeper in poverty someone is, the larger the poverty gap. The results from the 2014/15 and 2019/20 HBS revealed that the population living in rural areas are deeper in poverty (they are further away from the poverty line) than their urban counterparts. The poverty gap exhibits a similar trend over time but the gains are relatively marginal. The urban poverty gap has slightly decreased (by 0.2 percentage point) from 2014/15 to 2019/20 while the overall drop by 1.4 percentage points over the same period was mainly driven by a drop of poverty gap in rural areas of 2.2 percentage points.

Table 7. 5 Basic Needs Poverty Gap by Area, 2009/10, 2014/15 and 2019/20 HBS

	2014/15	2019/20	Change
Urban	3.2	3.0	-0.2
Rural	10.3	8.1	-2.2
Total	7.2	5.8	-1.4

More importantly, the poverty gap can allow the quantification of the absolute minimum in terms of how much money (transfer) would be needed to bring the poor population up to the poverty line. The amount of transfer is obtained by multiplying the poverty gap for Zanzibar (0.058) by the total population living in

private households (1,625,589) and by the basic needs poverty line value (TZS 66,313). This results in **TZS 6,252,265,635 per month (approximately US\$ 2.7 million per month)** needed to bring the total poor population of Zanzibar up to the basic needs poverty line, in case of ideal targeting.

The population living in rural areas have had some notable reduction in their extreme poverty gap because the food poverty gap has slightly declined from 2.9 percent in 2014/15 to 2.3 percent in 2019/20 (Table 7.8).

Table 7. 6 Food Poverty Gap by Area, 2009/10 and 2014/15 HBS

	2014/15	2019/20	Change
Urban	0.6	0.7	0.1
Rural	2.9	2.3	-0.6
Total	1.9	1.6	-0.3

7.6 Clustering Around the Poverty Line

It is possible to examine whether a significant share of the population remains vulnerable to poverty. Inspection of the distribution of adult equivalent consumption in 2019/20 reveals a sizeable concentration of households around the poverty line. To provide information on sensitivity of the headcount poverty rates to the poverty line, the basic needs poverty line was increased by 5, 10, and 20 percent. Table 7.9 shows that a 20 percent increase in the poverty line would increase the poverty headcount rate by 13.6 percentage points from 25.7 percent to 39.3 percent, which translates into an increasing number of the poor population by 53.0 percent. The sensitivity of headcount poverty rate with respect to the choice of food poverty line is also presented in Table 7.10.

Table 7. 7: Sensitivity of Headcount Poverty Rate with Respect to the Choice of Basic Needs Poverty Line, 2019/20 HBS

	Poverty Headcount Rate	Change from actual (%)
Actual	25.7	0
+5%	29.6	15.4
+10%	32.6	27.1
+20%	39.3	53.0
-5%	22.6	-12.1
-10%	18.7	-27.0
-20%	13.0	-49.2

Table 7. 8: Sensitivity of Headcount Poverty Rate with Respect to the Choice of Food Poverty Line, 2019/20 HBS

	Poverty Headcount Rate	Change from actual (%)
Actual	9.3	0
+5%	10.5	13.3
+10%	12.5	34.8
+20%	16.2	74.2
-5%	7.3	-21.5
-10%	6.0	-35.0
-20%	2.8	-69.7

7.7 Who has gained from increased consumption?

The Growth Incidence Curve in Figures 7.8, 7.9 and 7.10 show the change in mean per capita consumption between 2014/15 and 2019/20 on the Y axis and poorest to richest population on the X axis. The result reveals that the growth in consumption was pro-poor in urban areas as the line rises slightly at the beginning but then drops until a final peak at the very end of the distribution (the richest households). In the rural areas, however, (Figure 7.9), the line is largely flat but appears to rise as we approach the richest households. This implies that in the rural areas, the consumption growth of the richest households was faster than the consumption growth of their poorest counterparts. Overall, the Figure 7.10 suggests that the growth in per capita consumption was marginally higher for the richer households compared to the poorer households between the survey periods of 2014/15 and 2019/20.

Figure 7. 8: Growth Incidence Curve for Urban Areas, 2014/15 and 2019/20 HBS

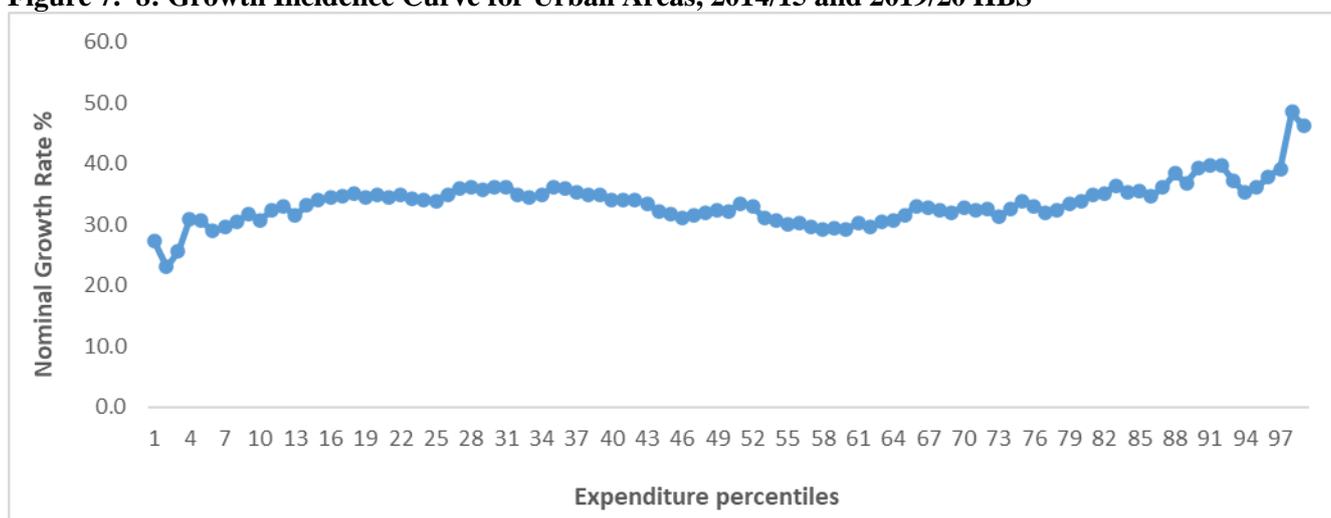

Figure 7. 9: Growth Incidence Curve for Rural Areas, 2014/15 and 2019/20 HBS

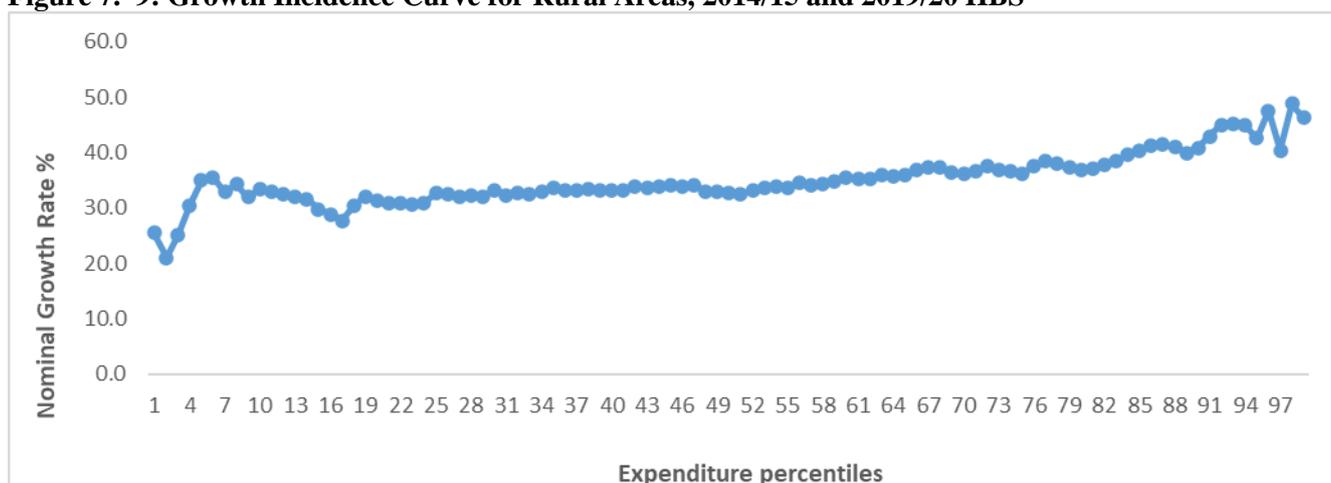

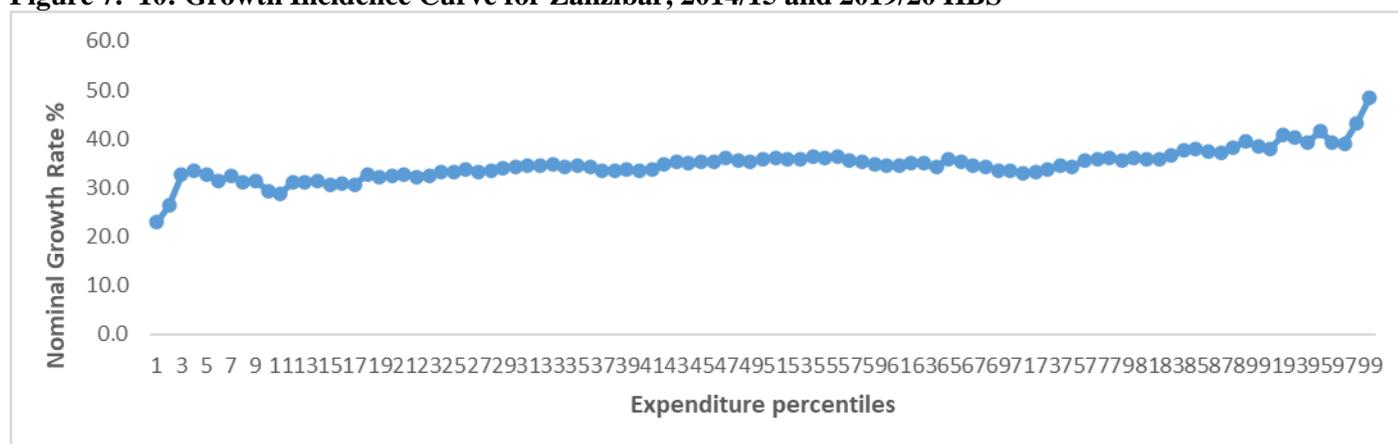

Figure 7. 10: Growth Incidence Curve for Zanzibar, 2014/15 and 2019/20 HBS

The decline in poverty from 2014/15 to 2019/20 could, further, be attributed to the nominal growth in adult equivalent consumption for both rural and urban areas within this period (Table 7.11).

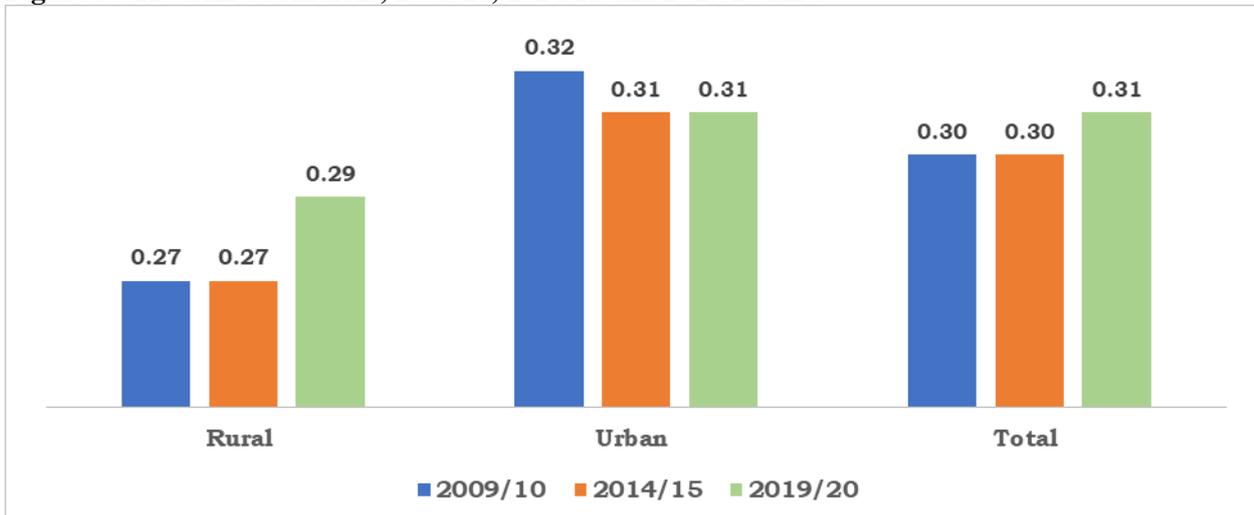

Table 7. 9 Mean and Median Per Adult Equivalent Consumption Expenditure and Nominal Growth, 2009/10, 2014/15 and 2019/20 HBS

	Mean	Median
2014/15		
Urban	96,841	80,470
Rural	67,843	58,649

Rural	94,257	79,769
Total	110,588	92,067
Percentage change		
Urban	35.5	33.5
Rural	38.9	36.0
Total	37.4	36.8

7.8 Inequality

Income inequality refers to the extent to which income is distributed unevenly among the population. Consumption per adult equivalent can be used to examine inequality of income. Gini coefficient is the most common index used to measure inequality. The Gini coefficient ranges from 0 (every person has the same consumption) to 1 (one person has all of the consumption in the country). The 2019/20 HBS shows a marginal increase in consumption inequality from 0.30 in 2014/15 to 0.31 in 2019/20. The rise was also observed in the rural areas (from 0.27 to 0.29) while inequality remained unchanged between the two periods in the urban areas (Figure 7.11).

Figure 7. 11: Gini Coefficient, 2009/10, 2014/15 and 2019/20 HBS

Furthermore, the observed changes in inequality between the periods of 2014/15 and 2019/20 are demonstrated through the Lorenz curves for urban and rural areas, as well as, the entire Zanzibar (Figures 7.12, 7.13 and 7.14). When there is a complete equality, the Lorenz curve coincides with the 45° ray through the origin of the curve. Conversely, there is inequality when the Lorenz curve deviates from the 45° ray. The greater the inequality, the further the Lorenz curve from the 45° ray. The result in Figure 7.12 confirms that between 2014/15 and 2019/20, the consumption inequality in the urban area was quite similar. In the rural areas, however, the Lorenz curves in Figure 7.13 confirm that inequality marginally increased in 2019/20 from the 2014/15 value (from 0.27 to 0.29). At the national level, the Figure 7.14 confirms the slight increase of inequality from 0.30 in 2014/15 to 0.31 in 2019/20.

Figure 7. 12: Lorenz Curve for Urban Areas, 2014/15 and 2019/20 HBS

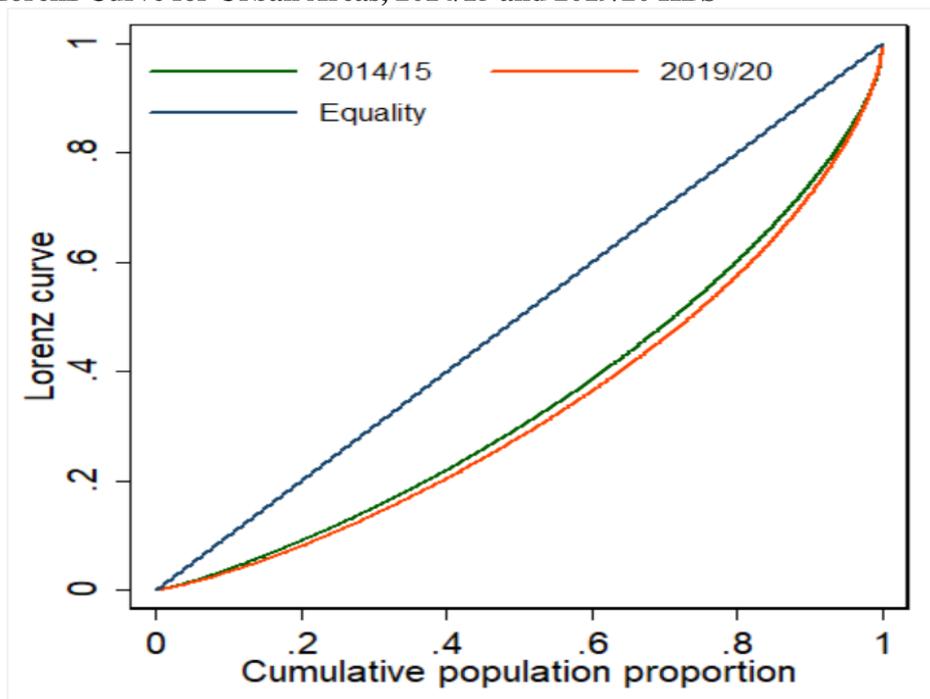

Figure 7. 13: Lorenz Curve for Rural Areas, 2014/15 and 2019/20 HBS

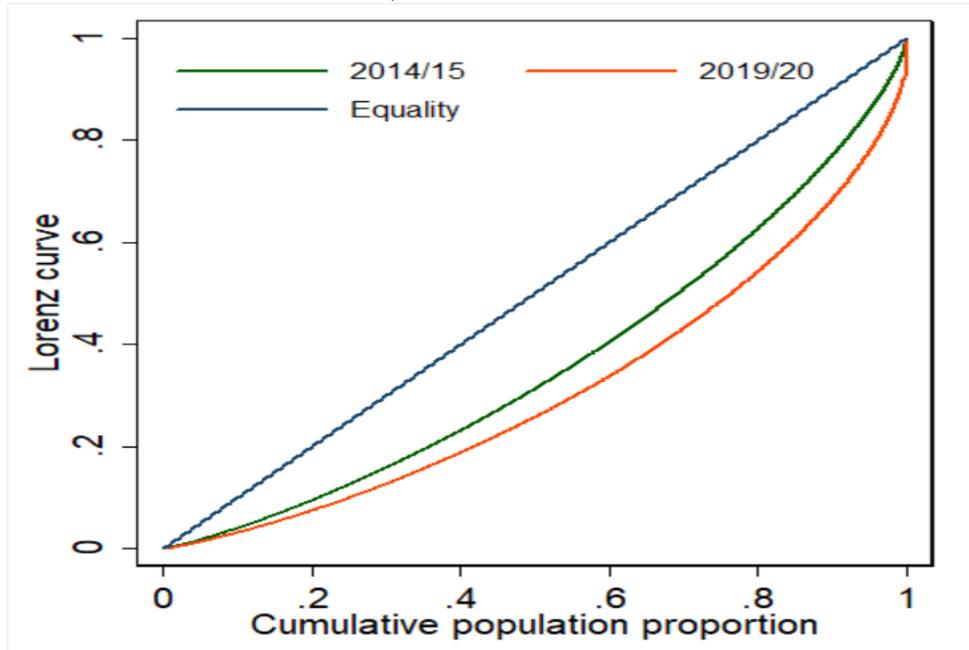

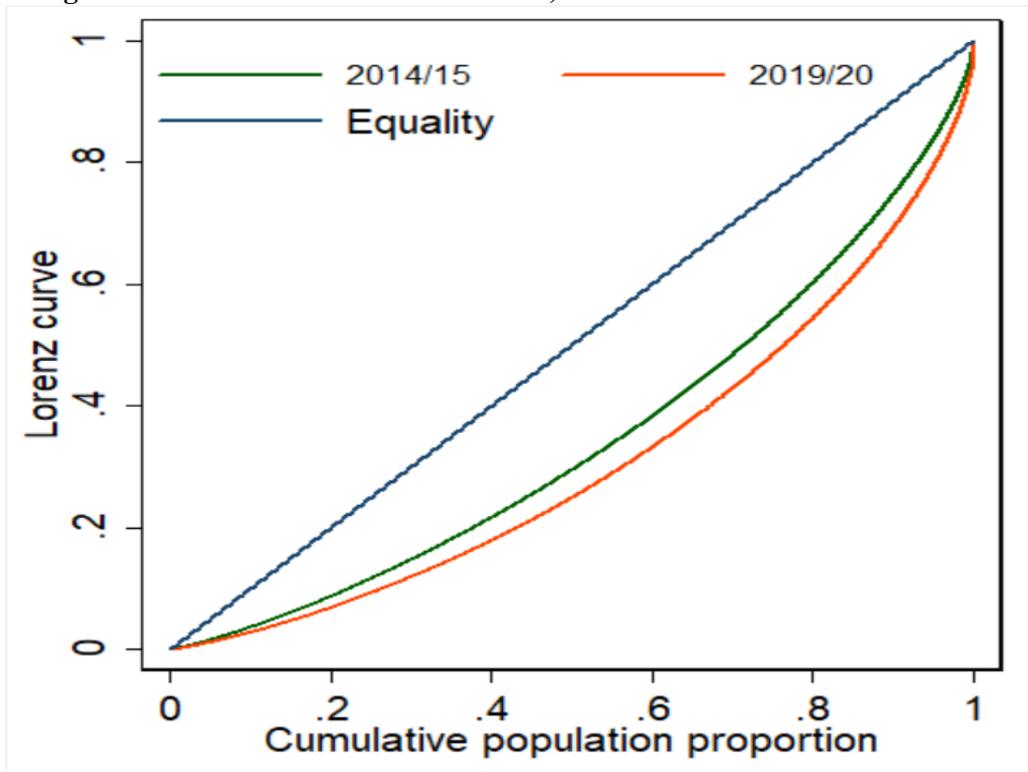

Figure 7. 14: Figure 7. 13: Lorenz Curve for Zanzibar, 2014/15 and 2019/20

In examining consumption inequality at the district level, the Table 7.12 shows a clear trend for the districts in Pemba. For instance; inequality seems to have marginally decreased in Wete over the last decade while Micheweni, Chake Chake and Mkoani have experienced noticeable increases in inequality. In Unguja, Kaskazini A and Mjini experienced noticeable decline in inequality between 2014/15 and 2019/20. From the 2019/20 HBS, the greatest inequality is found in Mkoani and the lowest inequality is found in Kusini.

Table 7.10: Gini Coefficient by District, 2009/10, 2014/15 and 2019/20 HBS

District	2009/10	2014/15	2019/20
Kaskazini A	24.3	28.5	25.9
Kaskazini B	25	27.8	27.0
Kati	27.1	25.3	26.7
Kusini	24.5	19.4	25.1
Magharibi	30.6	26.8	
Magharibi A			29.3
Magharibi B			31.0
Mjini	32.2	33.3	30.2
Wete	27.4	27.2	25.3
Micheweni	20.3	22.3	27.0
Chake Chake	28.7	28.9	31.7
Mkoani	26.9	27	32.1
Total	30.3	30.1	31.1

7.9 Other Measures of Inequality

According to the expenditure levels, the population can be divided into five equal groups (quintiles) where each group consist of one fifth of population with quintiles one (Q1) poorest 20 percent and Q5 the richest 20 percent of population. Table 7.13 clearly shows again how the urban population is richer than their rural counterparts. In 2019/20, 28.5 percent of the urban population are in the fifth quintile, while at the other end of the distribution only 10.9 percent of the urban population are in the poorest quintile (compared to 27.2 percent of the rural population).

Table 7. 11: Distribution of Population across Quintiles, 2014/15 and 2019/20 HBS

	Q1	Q2	Q3	Q4	Q5
2014/15					
Urban	8.9	15.7	21.1	23.8	30.5
Rural	28.6	23.3	19.1	17.1	11.9
Total	20	20	20	20	20
2019/20					
Urban	10.9	15.8	20.6	24.1	28.5
Rural	27.2	23.3	19.5	16.8	13.2
Total	20	20	20	20	20
Change					
Urban	2.0	0.1	-0.5	0.3	-2.0
Rural	-1.4	0.0	0.4	-0.3	1.3
Total	0	0	0	0	0

Additionally, quantile ratios are also straightforward indicators for examining inequality and they are easy to interpret. The most common quantile ratio is the 90/10 ratio, which is the equivalent consumption at the 90th percentile of the equivalent consumption distribution divided by the equivalent income at the 10th percentile. For example, if average monthly per equivalent expenditure for the 10th decile is 24,000 TZS and the same measure is 85,000 TZS for the 90th decile population then the Quantile Ratio is $(85,000 - 24,000)/85,000$ equals 71.7percent. Table 7.14 shows that the largest difference appears within the 90/10 group. The results also confirm the previous observations that inequality has marginally increased in 2019/20 across Zanzibar compared to the previous 2014/15 HBS and 2009/10 HBS.

Table 7. 12: Quantile Ratios of Per Adult Equivalent Consumption Expenditure, 2009/10, 2014/15 and 2019/20 HBS

	Ninety-Ten	Eighty-Twenty	Ninety-Fifty	Fifty-Ten

CHAPTER EIGHT A POVERTY PROFILE

8.1 Introduction

In this chapter, the poverty is reported in relation to a variety of demographic, economic and geographic characteristics. It is important to note that the 2009/10 poverty figures are based on the original methodology used during the 2009/10 HBS that produced a poverty rate of 44.4 percent. For the sake of clarity, the consumption indicator used for the 2009/10 poverty rates included amounts for durable goods, imputed rents and expenditure on ceremonies, while the consumption indicator for the poverty rates in 2014/15 and 2019/20 excluded these items. As a result, it is important to compare the actual rates between the three surveys with some degree of caution. When shown, the 2009/10 data is only presented to show whether the same trend is noted in subsequent surveys.

8.2 Poverty and Demographic Characteristics of the Household

The relationship between basic needs poverty rate and the size of the household is presented in Tables 8.1 and 8.2. The results reveal a positive relationship between poverty and household size. From the 2019/20 HBS for instance, the basic needs poverty headcount rate is 6.8 percent for single person household but reaches 46.3 percent for households with ten or more members. Across the three survey periods, as well as, both the rural and urban areas, the results in Tables 8.1 and 8.2 confirm that poverty rate increases with an increasing size of the household.

Table 8.1 : Distribution of Basic Needs Poverty Headcount Rate and Household Size by Area, 2009/10, 2014/15 and 2019/20 HBS

Household Size	Rural			Urban			Total

10+	24.7	30.2	27.3	40.0	43.9	32.5	30.0	33.7	28.6
Total Percent	100	100	100						
Total Poor Population	369,191	329,733	305,648	196,303	113,807	111,608	565,494	443,540	417,256
Total Population	733,758	821,202	907,234	534,152	635,823	718,355	1,266,910	1,457,025	1,625,589

In Tables 8.3 and 8.4, the relationship between the dependency ratio and basic needs poverty rate is presented. Households with a higher dependency ratio (i.e. a higher proportion of children aged 0-14 and/or persons aged 65 and above in relation to those aged 15-64) have a higher basic needs poverty headcount rate. From the 2019/20 HBS for instance, those living in households with a dependency ratio of 2.00+ had more than two times basic needs poverty rate of those living in households with a dependency ratio of 0.00 to 0.50. Furthermore, those living in households in the rural areas had higher poverty rates than their urban counterparts with the same dependency ratios. A similar pattern was observed during the 2009/10 and 2014/15 HBS.

Table 8.3: Distribution of Basic Needs Poverty Headcount Rate and Dependency Ratio by Area, 2009/10, 2014/15 and 2019/20 HBS

Dependency Ratio	Rural			Urban			Total

The incidence of poverty and household headship is presented in Tables 8.5 and 8.6. The results reveal that poverty rate male-headed households declined by about 6 percentage points between 2014/15 and 2019/20 while the poverty rate for female-headed households remained the same within the same periods. It is worth noting that as the proportion of the population living in female-headed households is smaller, they only represent 25.9 percent of the poor population in 2019/20 (Table 8.6).

Table 8.5: Distribution of Basic Needs Poverty Headcount Rate and Sex of Head of Household by Area, 2009/10, 2014/15 and 2019/20 HBS

Total Population	733,758	821,202	907,234	534,152	635,823	718,355	1,266,910	1,457,025	1,625,589

Overall the data shows that, poor households are larger in size and have more dependents than non-poor households. The interaction between family size and poverty is bidirectional. On the one hand, a large number of children and dependents affect the ability of the poor to cover their basic needs and to move out of poverty. On the other hand, poor households tend to have more children to compensate for their inability to rise from

poverty by investing in the human capital of their children and having many as an insurance strategy against infant mortality. This traps these households in a vicious circle of poverty.

8.3 Poverty and Economic Characteristics

Tables 8.7 and 8.8 report the incidence of poverty by the activity status of the head of household. Similar to 2014/15, the 2019/20 HBS reveal that the basic needs poverty headcount rate is highest for those households where the head is full time student (52.5 percent). The result for 2019/20 also curiously shows that poverty was lowest for people living in households whose heads were unemployed. This might not be any considerable as less than two percent (1.8 percent) of the poor were living in households headed by the unemployed. On a more substantive level, Table 8.8 shows that over eight out of ten poor people were living in households whose heads were employed (85.8 percent). The high poverty rate among households where the Head is working could illustrate the low wages received and/or a high dependency ratio in these households.

Table 8. 7: Distribution of Basic Needs Poverty Headcount Rate and Main Activity of Head of Household by Area, 2014/15 and 2019/20 HBS

Main Activity	Rural		Urban		Total

*Includes the elderly, disabled, sick persons.

Tables 8.9 and 8.10 examine the incidence of poverty and the occupation of the head of the households. Occupation refers to a person's job (task and duties performed) and includes both full time and part time jobs. It also includes people who are self-employed and those who are paid employees. Most respondents in the HBS survey are subsistence farmers, fishers or hunters (under the category of skilled agriculture and fishery). Similar to 2014/15, the 2019/20 results reveal that the basic needs poverty rate is highest for people residing in households whose heads were engaged in occupations classified as skilled agriculture and fishery. Within these occupations the basic needs poverty headcount rate is 37.8 percent for 2019/20 which represents just a marginal decline from 41.5 percent in 2014/15. The 2019/20 results further reveal that over five out of ten poor people (52.6 percent) are residing in households whose head are working in the skilled agriculture and/or fishery sector.

Tables 8.11 and 8.12 show the incidence of poverty by the number of household members in employment. The data clearly shows that being in work is not a guarantee of being out of poverty. Households with 4+ workers have the highest poverty headcount rate (36.5 percent) compared to households with lower number of members in employment. A possible explanation for this observation is that household with more members employed often have higher family size, and consequently higher number of dependants.

Table 8.11: Distribution of Basic Needs Poverty Headcount Rate and Number of Employees in the Household by Area, 2014/15 and 2019/20 HBS

In 2014/15 and 2019/20 HBS a series of questions were added to capture whether households were running any non-agricultural businesses. Tables 8.13 and 8.14 show that having a non-agricultural business is linked to having a lower poverty rate for both 2014/15 and 2019/20. In 2019/20 for instance, the national poverty headcount rate for Zanzibar is 25.7 percent, but if the household runs a non-agricultural business their poverty rate falls to 18.7 percent. The same trend is observed in both rural and urban areas. Furthermore, over eight out of ten poor people in Zanzibar do not run a non-agricultural business, which represents a marked increase from the 2014/15 value of 69.8 percent (Table 8.14).

Table 8.13: Distribution of Basic Needs Poverty Headcount Rate and Whether Household has Non Agricultural Business by Area, 2014/15 and 2019/20 HBS

Non-farm HH Business	Rural		Urban		Total

Total Population	821,202	907,234	635,823	718,355	1,457,025	1,625,589

In Tables 8.15 and 8.16, the relationship between headcount poverty and the household using agricultural land is displayed. Across the entire Zanzibar in 2019/20, headcount poverty rate is higher among households that use agricultural land (30.7 percent) compared to households that do not use agricultural land (22.8 percent). For urban households that are not using agricultural land, the poverty headcount rate is higher (16.5 percent) and for rural households that are not using agricultural land the poverty rate is lower (31.2 percent), while more than fifty percent (56.3 percent) of the poor population were not using agricultural land.

Table 8. 15: Distribution of Basic Needs Poverty Headcount Rate and Whether Household Uses Agricultural Land by Area, 2014/15 and 2019/20 HBS

Household Agricultural Land	Rural		Urban		Total	
	2014/15	2019/20	2014/15	2019/20	2014/15	2019/20

Total Population	821,202	907,234	635,823	718,355	1,457,025	1,625,589

The highlight of this section is that while poverty is often associated with joblessness, there is a considerable level of poverty in households whose members are employed. This could possibly be due to the low wages of the employed in Zanzibar as the low wages are not enough to lift them above the poverty line. Increasing welfare state provision, increasing minimum wages and absorbing the costs of education and health care are methods to potentially reduce the proportion of the working poor.

8.4 Poverty and Human Development Characteristics

Human development is a well-being concept and is an alternative approach to a single focus on economic growth. It focuses more on social justice as a way of understanding progress and on the process of enlarging people's choices to allow them to live a long and healthy life, to be educated and to enjoy a decent standard of living. Key social development indicators are education and health. This section examines the connection between these issues and poverty.

The results in Table 8.17 reveal that from the 2019/20 HBS, more than seven out of ten poor people were living in households whose heads only achieved Pre-school education were basic needs poor (73.7 percent), followed by Training after primary (52.3 percent), No education (44.0 percent), etc. Additionally, people living in households whose heads achieved a University education had zero incidence of poverty, which represents a 10.1 percentage point decline from the 2014/15 value for University education. Table 8.18 shows about one out of three basic needs poor people were residing in households whose heads achieved no education from the 2019/20 HBS.

Table 8.17: Distribution of Basic Needs Poverty Headcount Rate and Highest Level of Education Achieved by the Head of Household by Area, 2014/15 and 2019/20 HBS

Highest level of education achieved	Rural		Urban		Total

Total Population	821,202	907,234	635,823	718,355	1,457,025	1,625,589

Poverty is negatively correlated with higher levels of education of the household head. Higher education levels of the household's head, particularly secondary and upper education, seem to be associated with better income-generating opportunities and significantly lower poverty levels. Education positively affects living standards and poverty reduction both directly and indirectly through its impact on health gains, productivity, social integration, and so forth.

Tables 8.19 and 8.20 show self-reported illness by welfare level. There is no noticeable difference between whether someone reported illness during the last 4 weeks and the incidence of poverty. This is largely true for both 2014/15 and 2019/20 HBS. It is interesting to note, however, that over eight out of ten basic needs poor people reported no illness in the four weeks preceding the survey, which could indicate a very healthy poor population (Table 8.20).

Table 8.19: Distribution of Basic Needs Poverty Headcount Rate and Whether Ill in Last 4 Weeks by Area, 2014/15 and 2019/20 HBS

Health Status	Rural		Urban		Total	
	2014/15	2019/20	2014/15	2019/20	2014/15	2019/20

8.5 Poverty and Access to Utilities

Poor households are more likely to have limited access to basic services such as, clean drinking water, safe sanitation and electricity. Lack of basic services is an impediment to poverty reduction initiatives. Table 8.21 presents the relationship between poverty and some household utilities. Basic needs poverty rates were lower for households with facilities, such as improved water sources, toilet and connected to electricity grid. For example, the poverty rate for people living in households without access to improved water was almost twice as high as the poverty rate for those who have access to clean water. Furthermore, households with no toilets were two times more likely to be poor than those with toilets and a similar situation is seen in relation to access to electricity. This observation is largely true for both 2014/15 and 2019/20 HBS.

Table 8.21: Distribution of Basic Needs Poverty Headcount Rate by Utility, 2014/15 and 2019/20 HBS

Utility Type	Rural		Urban		Total	
	2014/15	2019/20	2014/15	2019/20	2014/15	2019/20
Water supply						
Improved source	38.5	31.6	17.7	15.4	28.9	24.0
Non improved source	51.6	50.6	28.6	17.5	48.5	47.0
Toilet facilities						
No Toilet	61.6	50.2	48.8	34.1	61.0	48.5
With toilet	31.9	26.1	17.4	14.5	24.5	20.0
Connection to electricity						
With electricity	19.9	18.8	14.8	13.8	16.2	15.5
Without electricity	45.8	41.8	28.1	27.2	42.4	39.9
Total Poverty Rate	40.2	33.7	17.9	15.5	30.4	25.7
Total Poor Population	329,733	305,648	113,807	111,608	443,540	417,256
Total Population	821,202	907,234	635,823	718,355	1,457,025	1,625,589

Obstacles to services, particularly electricity can seriously limit the possibilities of the poor to improve their living standards. Access to these services is still more limited in rural areas, hampering local opportunities to reduce poverty.

8.6 Child Poverty in Zanzibar

The results from the 2019/20 HBS revealed that about one in three (30.1 percent) of children aged 0 to 17 years experienced basic needs poverty. Over the past decade, child poverty has dropped by about 10 percentage points from 39.7 in 2009/10 to 30.1 percent in 2019/20, representing a decline by approximately one percentage point every year.

Children residing in rural areas experienced more than two times basic needs poverty (38.7 percent) compared to their urban counterparts (17.3 percent). However, over the past five years, the decline in child poverty was higher in rural areas (6.1 percentage points) compared to urban areas (2.6 percentage points). Child poverty in

urban areas however declined by 15 percent over the past decade in relation to just around 6 percent in rural areas.

At the district level, the reduction in child poverty is more prominent for the districts in Pemba with Micheweni experiencing a decline from a whopping 72.1 percent in 2014/15 to around 52 percent in 2019/20. Other districts that have made important progress include Chake Chake, Mkoani, Kusini and Kati. There is no difference in the level of poverty experienced by children living in female and male headed households. This holds largely true for the three survey periods presented in Table 8.22.

On the other hand, the level of poverty experienced by children clearly varies with the education level of the household head. From the 2019/20 HBS for instance, while just about 11 percent of children living in a household with a head who had secondary or higher education experienced poverty, in the households where the head had no education, 35.4 percent of children fall below the basic needs poverty line. Interestingly, there is a difference in poverty levels according to the age of the child, where poverty is lowest among the children under 5 (25.7 percent) and highest among children aged 12-15 (35.3 percent). Examining changes over time, there has been no marked change in the proportion of children who experience food poverty in Zanzibar since 2009/10. At the district level, Micheweni, Chake Chake and Wete experienced noticeable declines in food poverty among children from 2014/15 to 2019/20.

Figure 8.1: Basic needs Poverty Among Children by Districts in Zanzibar, 2014/15 and 2019/20 HBS

**CHAPTER NINE:
HOUSEHOLD NON-AGRICULTURAL BUSINESS AND INDIVIDUAL INCOME**

9.1 Introduction

Questions regarding household businesses were asked to measure the income of household members derived from their business activities. In this chapter, household's source of income from business, both in cash and in kind are analysed. Information is also given on household business by type of premises where they operate, ownership status and household involvement in business by sex. Business by status of registration and taxpaying, sources of start-up capital for the business, expenditure on business inputs, types of investments, employment status of household and non-household members in business are also discussed. This chapter, therefore, relates only to non-agricultural businesses.

9.2 Households Running their Own Business

Overall, in Zanzibar, about half of all households (48.9 percent) run a business (146,555 household businesses from a total of 300,881 households in Zanzibar). Households living in urban areas run more businesses (54.6 percent in 2019/20 HBS and 55.5 percent in 2014/15 HBS) compared to households in rural areas (47.6 percent in 2019/20 HBS and 44.5 percent in 2014/15 HBS). Most households (67.1 percent in 2019/20 HBS) run only one business whereas a quarter of households (25.2 percent) have two businesses. The total number of businesses increased from 108,727 businesses from 2014/15HBS to 146,555 businesses in 2019/20 HBS (Table 9.1).

Table 9.1: Distribution of Businesses by Area, 2019/20 HBS

Number of Businesses	2014/15			2019/20

9.3 Business Premises

Information on the type of premises where a business is operated is vital for business formalisation and tax payment. Businesses operating in non-fixed locations are often not formalised, are unregistered and often not paying taxes. Table 9.2 shows that 33.1 percent of 2019/20 HBS household businesses in Zanzibar are operating in a special business space, and 12.0 percent in a permanent building other than the respondent's home. The percentage of businesses operating in a vehicle, cart, and temporary stall on the street is nearly the same in both rural and urban areas. The rank of types of premises leading in 2014/15 HBS were the same as 2019/20 HBS.

Table 9. 2: Percentage of Businesses and Type of Premises by Area, 2019/20 HBS

Premises Type	2014/15			2019/20		
	Rural	Urban	Total	Rural	Urban	Total
In own or business partner's home with special business space	31.5	28.6	29.9	28.2	37.3	33.1

Total Number of Businesses	48,338	60,389	108,727	66,580	79,975	146,555

9.4 Ownership Status

Respondents were asked whether they or any household member own the business or whether they formed a partnership with others such as NGOs or religious organizations. The results in Table 9.3 show that nearly all businesses are sole ownerships from both 2014/15 HBS (93.9 percent) and 2019/20 HBS (97.1 percent) but a small percentage (6.1 percent in 2014/15 HBS and 2.5 percent in 2019/20 HBS) run as a partnership.

Table 9. 3: Percentage of Businesses by Type of Ownership, 2014/15 and 2019/20 HBS

Total Number of Businesses	48,338	60,389	108,727	66,580	79,975	146,555

9.5 Source of Start-Up Capital

Table 9.4 shows that from both 2019/20 HBS and 2014/15 HBS, the largest source of start-up capital was respondents' own savings (64.2 percent and 66.5 percent respectively), followed by a gift from family or friends (18.1 percent and 10.1 percent respectively). Furthermore, more household businesses situated in the rural areas derived their start-up capital from proceeds from agricultural activities than their counterparts in the urban areas.

Table 9. 4: Percentage of Business by Main Source of Start-up Capital by Area, 2014/15 and 2019/20 HBS

Source of Capital	2014/15			2019/20

9.6 Expenditure on Inputs for the Business

Business inputs refer to the amount added in order to sell things at a profit (this includes everything necessary to add value to a product). Table 9.5 displays the expenditure associated with running all businesses. From the 2019/20 HBS, the highest cost of business inputs in 12 months was TZS 415,236,128,656 spent on purchasing goods bought for resale. This was followed by the cost of raw materials amounting to TZS.183,183,204,663 Expenditure on inputs is generally higher in urban areas as there are more businesses within urban areas for both 2019/20 and 2014/15 HBS. From the 2019/20 HBS, the total amount spent for businesses inputs were higher (TZS 752,753,500,000) compared with 2014/15 HBS (TZS 527,435,000,000).

Table 9. 5: Total Amount (100,000 TZS) Spent for Business Inputs in the Last 12 Month by Area, 2014/15 and 2019/20 HBS

Business Inputs	2014/15			2019/20

9.7 Non-wage income (Remittance and Assistance)

Remittances and or assistance is not a new phenomenon in the world, being a normal concomitant to migration and or reliefs which has always been a part of humanity. Table 9.6 shows that an assistance from household or person within Zanzibar is higher (TZS 9,137,917,277) than assistance and remittance from Tanzania mainland (TZS 2,295,118,303) and abroad (TZS 4,450,385,762). Rural areas received more money from other households or persons within Zanzibar as well as food assistance.

Table 9.6: Remittance and Assistance (100,000) by Area, 2019/20 HBS

Non-Wage Income	Rural	Urban	Total
Money from a household or someone else within Zanzibar	50,140.5	41,238.7	91,379.2
Money from a household or someone else in Tanzania Mainland	13,229.9	9,721.3	22,951.2
Money from a household or someone else out of Tanzania	14,706.2	29,797.7	44,503.9

9.8 Main Source of Business Income

A household's main source of business income can provide an indication of business performance and its contribution to the household's disposable income. Table 9.7 shows the distribution of businesses by the main source of income expressed in percentage values. Overall, TZS 17,694,966,784 constituting 50.9 percent of the total businesses in Zanzibar received income from sales of goods purchased for resale.

Table 9.7: Percentage of Annual Business Income Received by Area, 2019/20 HBS

Source of Income	Rural	Urban	Total
Sale of products mined/manufactured	19.9	25.0	23.0
Sale of goods purchased from others for resale	54.6	48.6	50.9
Construction work done	0.0	0.1	0.0
Receipts for services rendered	24.2	23.8	23.9
Rent from land	0.6	0.0	0.2
Rent from buildings	0.0	0.9	0.6
Hire out of equipment/tools	0.0	0.9	0.5
Dividends receivable	0.0	0.0	0.0
Income received as a gift, donations, gain in the sale of as	0.3	0.7	0.5
Other income (specify)	0.3	0.1	0.2
Total Percent	100.0	100.0	100.0
Total Amount in TZS (00000)	1,607,807	2,562,226	4,170,034

9.9 Capital Investment in Business

Investment is the accumulation of newly produced products such as factories, houses, machinery and equipment. Table 9.8 reveals that the total expenditure investment of TZS 393,840,000 (56.6 percent) was used for construction of business premises, which is the largest form of capital investment. The highest investment in rural areas was for expenditure on machinery and equipment (e.g block machine) (36.8 percent) while the highest investment in the urban areas was for expenditure of own construction of business premises (72.0 percent).

Table 9. 8: Percentage of Total Business Investment in TZS during the Last 12 Months by Area, 2019/20 HBS

	Rural	Urban	Total
Purchase of premises (shop, offices etc)	18.6	3.4	6.8
Expenditure of own construction of business premises	3.1	72	56.6
Expenditure on capital repairs (e.g sewing machines)	2.3	6.4	5.5
Expenditure on machinery and equipment (e.g block machine)	36.8	5.5	12.5
Expenditure on transportation equipment (e.g vehicle accesso	39.2	12.6	18.6
Total Percent	100	100	100
Total Amount in (1,000)	155,024	540,558	695,582

9.10 Other Non-Capital Business Expenditure

Expenditure on land, buildings and other fixed assets were examined in Table 9.9. Most amount (71.3 percent) spent in the last 12 months was on purchasing buildings (TZS 78,263,800 total amount spent), with about 11 percent spent on transportation equipment.

Table 9. 9: Percentage of Amount in TZS Spent on Businesses during 12 Months Prior to the Survey, 2019/20 HBS

Category of Expenditure	Rural	Urban	Total
Land	24.0	1.3	5.0
Buildings	30.2	79.1	71.3
Other structures (kiosks etc)	25.8	5.3	8.6
Other machinery, equipment and small tools	3.9	4.0	4.0
Expenditure on transportation equipment	16.1	10.2	11.1
Total Percent	100	100	100
Total Amount spend	17,536,900	92,230,000	109,766,900

9.11 Business Registration, Tax Payment and Record Keeping

The law requires any business of any size in Zanzibar prior to operation, to obtain a business license/registration, a process which aims to ensure a proposed business adheres to the country's laws and regulations including the payment of taxes. It is difficult for the government to collect taxes from unregistered businesses. The results from the 2019/20 HBS (Table 9.10) show that 72.4 percent of businesses in Zanzibar are not registered. The proportion of registered businesses increased from 13.7 percent in 2014/15 HBS to 27.6 percent 2019/20 HBS. There are only marginal differences between the rural and urban areas with respect to business registration.

Table 9. 10: Percentage of Businesses and Registration Status by Area, 2014/15 and 2019/20 HBSs

Status	2014/15			2019/20		
	Rural	Urban	Total	Rural	Urban	Total
Registered	14.2	13.3	13.7	23.8	30.7	27.6
Not registered	84.8	85.6	85.3	76.2	69.3	72.4
Not stated	0.9	1.1	1.0	0.0	0.0	0.0
Total Percent	100	100	100	100.0	100.0	100.0
Total Businesses	48,338	60,389	108,727	66,580	79,975	146,555

Table 9.11 shows that a very small percentage of businesses are paying any sort of tax. Only 1.2 percent of businesses pay VAT from the 2019/20 HBS, which is lower compared to the 2014/15 HBS (5.0 percent). Over eight out every ten businesses do not pay any taxes (81.2 percent in 2019/20 HBS) while 2014/15 HBS showed that almost three quarters (74.6 percent) of businesses do not pay as they earn (PAYE). There are only marginal differences between the rural and urban areas with respect to the payment of taxes by businesses in Zanzibar.

Table 9. 11: Percentage of Businesses by Type of Tax Paid, 2014/15 and 2019/20 HBS

Type of Tax	2014/15			2019/20		
	Rural	Urban	Total	Rural	Urban	Total
Value added tax (VAT)	4.3	5.5	5	1.4	1.1	1.2
Pay as you earn (Paye)	4.4	5.2	4.8	8	4.7	6.2
Income Tax	8.7	9.7	9.2	7.1	11.6	9.6

Not paying any taxes	75.6	73.8	74.6	81.5	81	81.2
Total Businesses	48,338	60,389	108,727	66,580	79,975	146,555

Table 9.12 shows that 72.4 percent of businesses in Zanzibar do not keep business records. The incidence of not keeping records is higher in rural areas (76.2 percent) than in urban areas (69.3 percent).

Table 9. 12: Percentage of Businesses and Status of Record Keeping by Area, 2019/20 HBS

Status	Rural	Urban	Total
Keeping records	23.8	30.7	27.6
Not keeping records	76.2	69.3	72.4
Total Percent	100	100	100
Total Businesses	66,580	79,975	146,555

9.12 Employment Status: Household and Non-Household Members

An examination of the employment status of household members working in the business (Table 9.13) shows that most household members were employed as working proprietors (81.7 percent) with a slight difference between rural and urban areas. In terms of non-household members, the majority of them were paid regular employees (4.0 percent), followed by paid casual employees (3.4 percent).

Table 9. 13: Employment Status of Household and Non-Household Members by Area, 2019/20 HBS

Employment Status	Rural	Urban	Total
Household members			
Working proprietor	81.1	82.3	81.7
Paid regular	0.2	0.6	0.4
Paid casual	0.9	2.4	1.7
Unpaid helper/family worker	19.5	14.7	16.9
Total Individuals	66,580	79,975	146,555
Non household members			
Working proprietor	1.8	0.8	1.3
Paid regular	5.1	3.2	4.0
Paid casual	2.2	4.3	3.4
Unpaid helper/family worker	2.2	0.6	1.3
Total Individuals	66,580	79,975	146,555

Table 9.14 shows that for non-household members employed in the businesses, the majority of them are men (79.6 percent). The prevalence of male employees as casual workers is considerably higher (84.5 percent) than females (15.5 percent).

Table 9.14: Non-Household Members Working in the Household Business by Sex, Employment Status and Area, 2019/20HBS

Employment Status	Rural			Urban			Total		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
Paid in contract basis	50.4	49.6	100	72.9	27.1	100	69.7	30.3	100
Paid in casual worker	86.8	13.2	100	90.3	18.0	100	84.5	15.5	100
Total	82.6	17.4	100	77.7	22.3	100	79.6	20.4	100

9.13 Payment to Non-Household Employees, Cash and In-Kind

An average of TZS 169,380 per month was paid to non-household members working in the household businesses as contract basis employees (Table 9.15). Casual workers received higher payment on average (TZS 307,853) than contract basis employees in a month. The payments difference between employees in rural and urban areas for both types of employment status is almost the same. Furthermore, contract or casual workers who were paid in cash received more remuneration in both rural and urban areas compared to contract or casual worker who were paid in kind (Table 9.15).

Table 9.15: Mean Monthly Payment (TZS) to Non-Household Member Employees by Employment Status and Area, 2014/15 HBSs

Employment Status	Rural	Urban	Total
Cash			
Paid in contract basis	121,823	177,101	169,380
Paid in casual worker	342,757	268,785	307,853
Total	317,051	225,158	261,826
In kind			
Paid in contract basis	43,203	7,433	12,429
Paid in casual worker	77,356	5,968	43,672
Total	73,382	6,665	33,287

9.14 Non-Salary Sources of Income at the Individual Level

In this survey, household members (aged five years and above) were asked about the sources of non-salary income over the last 12 months. The income recorded included both cash and respondents estimated in kind amounts. The main sources of income were loans, money from other people in Zanzibar and items given by people in Zanzibar (mobiles phones, iron for building, items for transportation etc). The mean average monthly income from each source is also shown in Table 9.16.

Table 9. 16: Average Income in the Last Month by Area, 2019/20 HBS

Source of Income	Rural	Urban	Total
Income or food obtained from work or food plan	117,237	111,518	115,758

**CHAPTER TEN:
TRIPS FOR BUSINESS AND RECREATION**

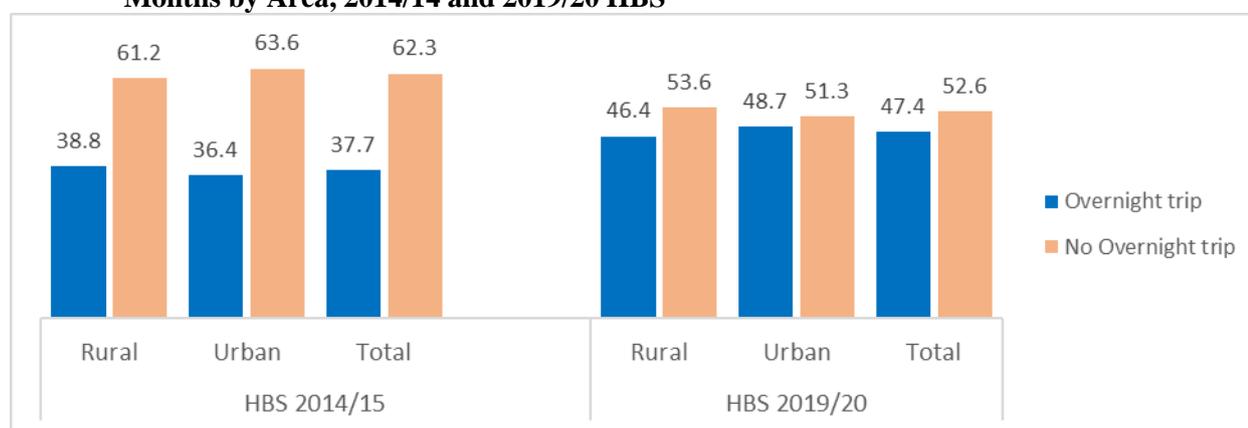

10.1 Introduction

For the second time in the Zanzibar Household Budget Survey, a series of questions were dedicated to issues around trips for business and recreation. Zanzibar, as a developing semi-autonomous region aims to achieve economic growth and poverty reduction. This can be facilitated by implementing sound macroeconomic reforms which include a conducive investment environment to attract both domestic and international investments. Notable achievements have been made in the tourism sector where increased investment in accommodation and visits to historical sites and other tourist attractions have been registered. Consequently, it was deemed important to consider tourism as one of the important components of the HBS. Two types of tourism included in this chapter are domestic tourism (within Zanzibar and Tanzania Mainland) and International tourism.

10.2 Taking at least one trip overnight in the last 12 months

The results from Figure 10.1 shows that overall, 47.4 percent of households from the 2019/20 HBS had made at least one overnight trip in the last twelve months, which is higher compared to 37.7 percent in 2014/15 HBS. The results show that a higher percentage of people made more trips in this year due to the presence of accessible requirements like impressive cities, expansion of business/trade, joining the family etc. Such trips were slightly more common in households living in urban areas (48.7 percent) compared to those living in rural areas (46.4 percent) from the 2019/20 HBS. If households made multiple trips in the last twelve months, they were asked about the most recent one they made.

Figure 10. 1: Percentage of Households who had Taken at Least One Overnight Trip in the Last 12 Months by Area, 2014/14 and 2019/20 HBS

Quite similar to the 2014/15 HBS (65.5 percent), most of the households that made trips resided in the Kusini district (69.5 percent). The proportion of households that made trips from the Wete district has approximately doubled over the last 5 years (from 27.1 percent in HBS 2014/15 to 49.4 percent in HBS 2019/20). Furthermore, 61.8 percent of households in Chake Chake took at least one trip over the last 12 months while Kaskazini B had the least proportion of households (32.3 percent) taking a trip within the same period (Table 10.1).

Table 10.1: Percentage of Households who had Taken at Least One Overnight Trip in the Last 12 Months by District, 2014/14 and 2019/20 HBSs

District	HBS 2014/15	HBS 2019/20
Kaskazini A	52.6	41.8
Kaskazini B	47.1	32.3
Kati	39.7	59.6
Kusini	65.5	69.5
Mjini	37.7	51.8
Magharibi A	33.0	40.0
Magharibi B	N/A ⁹	45.0
Wete	27.1	49.4
Micheweni	26.7	39.5
Chake Chake	43.6	61.8
Mkoani	31.0	45.6
Total percent	37.7	47.4

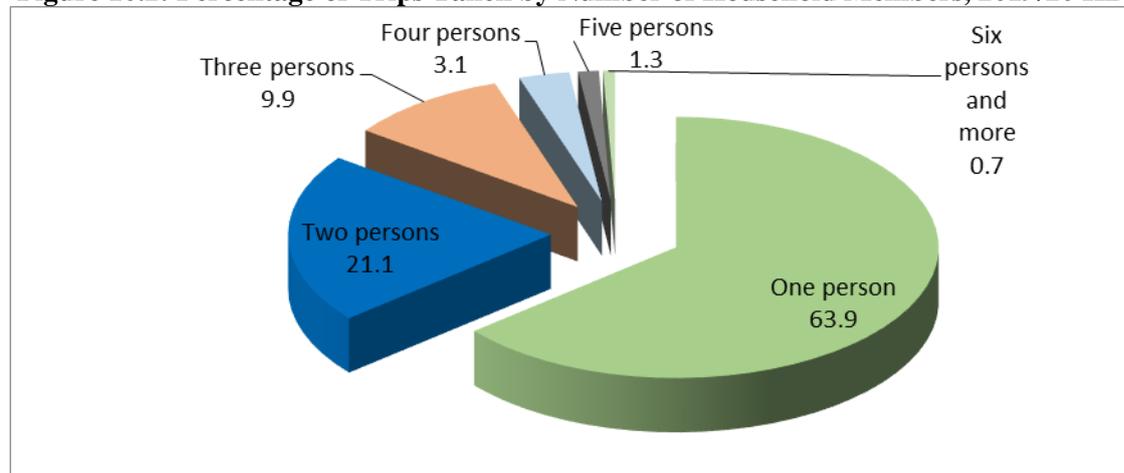

Table 10.2 shows that about 69.2 percent of the trips were taken within Zanzibar while 29.7 percent of the trips were taken in Tanzania Mainland. There appears to be a small increase in average trips that were taken outside of Tanzania between HBS 2014/20 and HBS 2019/20. This is mainly driven by increasing awareness of the Zanzibar is regarding business activities and extension of the scope of the trade activities outside of Zanzibar.

Table 10.2: The Percentage Distribution of Trips Taken.

	HBS 2014/15	HBS 2019/20
Zanzibar	69.0	68.2
Tanzania Mainland	30.0	29.7
Abroad	1.0	2.1
Total percent	100.0	100.0

Figure 10.2 reveals that nearly two-third of these trips (63.9 percent) were taken by one person in the household; 21.1 percent of trips by two people; a further 13.0 percent by three to five people; and the remaining 0.7 percent trips were taken by six or more people in the household.

Figure 10.2: Percentage of Trips Taken by Number of Household Members, 2019/20 HBS

⁹ N/A here means the District was not existed yet.

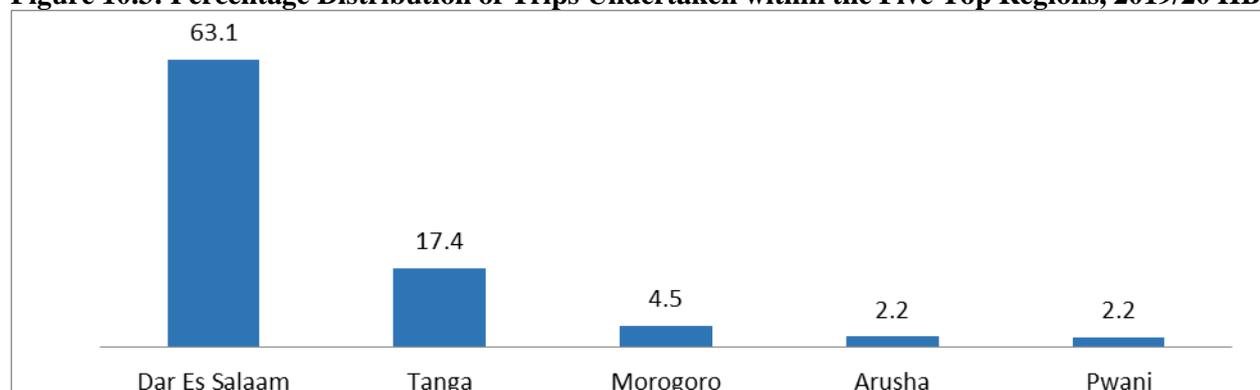

Among the trips that were taken by households within Zanzibar, most of them (17.2 percent) were taken to Mjini district while only few (3.7 percent) were taken to Kusini district. Wete and Micheweni districts show almost the same pattern (Table 10.3).

Table 10.3: Percentage of Households who had Taken At Least One Overnight Trip in the last 12 Months by District, 2019/20 HBS

District	Yes	No	Total
Kaskazini A	7.8	9.9	8.9
Kaskazini B	4.5	8.4	6.5
Kati	8.1	4.9	6.4
Kusini	5.5	2.2	3.7
Mjini	18.8	15.8	17.2
Magharibi A	10.1	13.6	11.9
Magharibi B	15.2	16.7	16.0
Wete	8.2	7.6	7.8
Micheweni	6.4	8.9	7.7
Chake Chake	8.7	4.9	6.7
Mkoani	6.7	7.2	6.9
Total percent	100.0	100.0	100.0
Total Household	142,634	158,247	300,881

Among the trips that were taken by households to five top regions in Tanzania Mainland, the Dar es Salaam Region had the highest proportion of trips (63.1 percent), followed by Tanga (17.4), Morogoro (4.5 percent), while only few (2.2 percent) of trips were taken to Pwani and Arusha Region each (Figure 10.3).

Figure 10.3: Percentage Distribution of Trips Undertaken within the Five Top Regions, 2019/20 HBS

10.3 Number of Nights Spent on a Trip

Households were asked about the number of days they spent on a trip. The results from Table 10.5 reveal that most households (24.5 percent) spent 2 to 3 days on a trip, followed by 22.1 percent that spent 4 to 7 days on a trip and 17.1 percent of that spent 15 to 30 days on a trip. Fewer households (about 11 percent) spent 8 to 14 days, and more than a month on trips (about 11 percent). The examination of the data separately for urban and rural areas show that most of households in urban areas spent 4 to 7 days (25.3 percent) on trip. The average number of nights spent on the trip was 18.4 nights.

Table 10. 4: Percentage of Households by Number of Nights Spent on the Trip and Area, 2019/20 HBS

Length of Trip	Rural	Urban	Total
1 day	15.7	10.0	13.1
2 to 3 days	25.5	23.3	24.5
4 to 7 days	19.4	25.3	22.1
8 to 14 days	9.3	15.0	11.9
15 to 30 days	15.2	19.4	17.1
More than a month	14.9	6.9	11.2

Table 10.5 shows that Mjini district had the highest proportion of mean number of nights spent on the trip with 18.8 percent while Kaskazini B recorded the lowest ratio of 4.6 percent. Most of the households spent 2 to 3 days on their trips while about 22.2 percent of the households in Micheweni district spend a month or more on their trip but only 1.2 percent household in Mkoani spent 1 day.

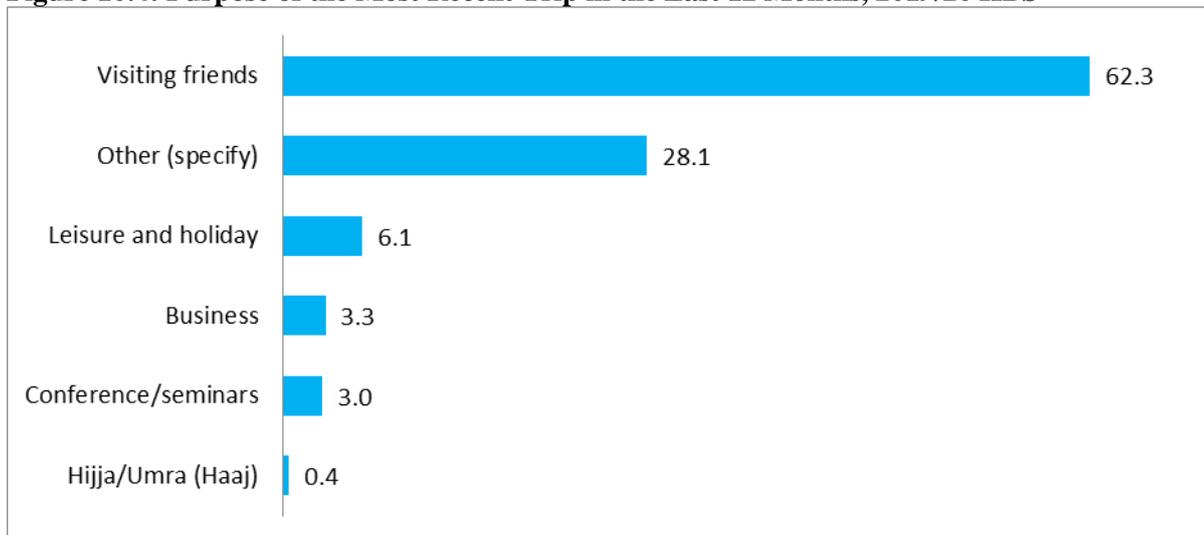

Table 10.5: Percentage of Households by Mean Number of Nights Spent on the Trip by District and Area, 2019/20 HBS

District	1 day	2 to 3 days	4 to 7 days	8 to 14 days	15 to 30 days	A month or more	Total
Kaskazini A	17.1	8.6	9.6	3.9	2.8	3.8	7.8
Kaskazini B	3.9	7.9	6.1	2.4	1.6	1.0	4.6
Kati	14.0	12.8	7.4	5.5	2.9	2.9	8.1
Kusini	17.2	8.4	2.9	1.9	0.5	2.0	5.5
Mjini	22.7	17.7	17.4	26.7	19.9	9.5	18.8
Magharibi A	7.7	9.3	12.3	10.8	10.4	8.7	10.1
Magharibi B	5.3	14.9	22.8	17.2	17.3	7.1	15.2
Wete	4.3	7.4	5.6	10.5	12.4	10.5	8.2
Micheweni	4.2	2.8	3.0	3.6	9.4	22.2	6.4
Chake Chake	3.0	6.2	6.5	11.2	13.8	15.0	8.7
Mkoani	0.6	4.0	6.3	6.3	8.9	17.4	6.7
Total	13.1	24.5	22.1	11.9	17.1	11.2	100.0
Total Household	18,677	34,977	31,530	16,989	24,426	16,034	142,634

10.4 Purpose of the Trip

Over six out of every ten households stated that they travelled to visit friends (62.3 percent), and this was the main reason of their trips. This is because the dominance of purpose of visiting friends is said to be attributed with the core structure of Ujamaa, which is the traditional extended family and clan structure of most ethnic groups which provides a framework for mutual assistance and cooperation. The second reason mentioned was leisure and holiday (6.1 percent), followed by business reasons (3.3 percent), and only 0.4 percent of the households travelled for Hijja/Umra in Saudi Arabia.

Figure 10.4: Purpose of the Most Recent Trip in the Last 12 Months, 2019/20 HBS

When asked about the main activities during the trip (again respondents were allowed to mention up to three activities), the ranking is as follows:

Table 10. 6: Main Activities During the Trip in the Last 12 Months, 2019/20 HBS

Main Activity	Percentage
National Park Safari	1.6
Beach tourism	6.3
Culture/Historical tourism	6.4
Hunting	0.1
Hijja/Umra	0.4
Social and Familial Activities	87.0
Total	100.0
Total Households	138,504

Table 10.6 reveals that most of household (6.3 percent) took a trip for beach tourism because beaches are great resources for tourism. The beaches attract a large number of domestic and inbound tourists for any country blessed with sea and ocean. By far, social and activities related to family dominated the main purposes for trips taken within the last 12 months.

In Table 10.7, the main means of transport for the household trips from the 2019/20 HBS have been presented. The results reveal that ferry or boat (54.3 percent) was the most used mean of transport for trips, followed by public transport (37.5 percent), air transport (3.7 percent), with only 1.9 percent of households using their own cars. The Table 10.7 also reveals that the usage of aeroplane was higher in urban areas (5.8 percent) than in rural areas (1.8 percent).

Malindi Ferry Terminal, Stone Town, Zanzibar

Table 10.7: Main Means of Transport Used in the Most Recent Trip in the Last 12 Months, 2019/20 HBS

Means of transport	Rural	Urban	Total
Aeroplane	1.8	5.8	3.7
Own car	2.3	1.5	1.9
Car-hire (includes taxi)	2.1	0.5	1.4
Bus	45.5	28.9	37.9
Motorcycle/Vespa	0.6	0.5	0.5
Water/Marine Transport	47.4	62.6	54.3
Other	0.4	0.2	0.3
Total percent	100.0	100.0	100.0
Total Households	77,399	65,234	142,634

Table 10.8 presents the respondent's place of stay during the trip in the last 12 Months from the 2019/20 HBS. The results reveal that 90.6 percent stayed in private homes, 1.7 percent stayed in guest houses and 0.6 percent stayed in hostels but those stayed in the Park/Forestry/Lodge were the least accounting for just 0.4 percent. The Table 10.10 also reveals that more urban households prefer to stay in towns (5.8 percent) on trips than rural household (1.8 percent).

Table 10.8: Respondents' Place of Stay During the Trip in the Last 12 Months, 2019/20 HBS

Place of Stay	Rural	Urban	Total
Town	1.8	5.8	3.5
Hotel in the Park/Forestry/Lodge	0.6	0.2	0.4
Guest house	1.3	2.3	1.7
Hostels	0.9	0.1	0.6
Private home	90.7	88.7	89.9
Other	4.7	2.9	3.9
Total Household	78,521	59,982	138,504

10.5 Average Expenditure (TZS) on Personal and Business trips

In the case of personal trips made within Zanzibar, the average expenditure was 33,442 in the 2019/20 HBS. The households mostly spend on accommodation during the personal trips within Zanzibar. The household spent an average of 126,086 Tanzania Shillings on accommodation in the last 12 months. However, in the business trips within Zanzibar, households mostly spend on shopping, which involve the purchasing of goods for the businesses. The households spent an average of TZS 455,019 on shopping in 2019/20 HBS, which was higher compared to TZS 342,502 average expenditure recorded in the 2014/15 HBS. Furthermore, the Table 10.9 shows that the average expenditures of household for shopping in rural areas for personal and business trips within Zanzibar are higher than that of urban areas in both cases.

Table 10. 9: Average Expenditure (TZS) for all Trips in the Last 12 Months, 2019/20 HBS

Personal trips within Zanzibar	Rural	Urban	Total
Food and drinks	22,154	17,686	19,790
Accommodation alone	62,420	143,387	126,086
Transport	26,831	31,925	28,985
Shopping	123,521	37,409	79,270
Recreational activities	8,000	17,547	17,153
Other (specify)	25,223	52,000	27,130
Total	36,001	30,418	33,442
Business trips within Zanzibar			
Food and drinks	43,160	36,854	39,425
Accommodation alone	50,000	66,499	63,919
Transport	41,612	39,865	40,679
Shopping	781,640	253,298	455,019
Recreational activities	32,112	0	32,112
Total	127,508	70,630	95,111
Personal trips outside Zanzibar	Rural	Urban	Total
Food and drinks	61,968	39,705	47,053
Accommodation alone	269,054	192,378	214,882
Shopping	69,361	134,277	117,505
Recreational activities	51,034	15,000	47,131
Other	230,000	2,140,070	1,771,386
Transport to and from Tanzania	274,147	231,214	244,768
Transport while abroad	64,111	81,510	75,982
Total	143,967	158,909	154,229
Business trips outside Zanzibar	Rural	Urban	Total
Food and drinks	73,578	37,259	50,434
Accommodation alone	216,537	93,556	116,696
Shopping	561,561	775,412	701,267
Recreational activities	0	0	0
Other	0	0	0
Transport to and from Tanzania	96,192	120,101	113,606
Transport while abroad	33,375	37,100	35,715
Total	151,964	171,164	165,014

In relation to business trips outside of Zanzibar, the largest expenditure is once again for shopping (the purchase of raw materials, items to sell etc.). The average expenditure on accommodation is lower than for personal trips as perhaps business people are more likely to build up connections that allow them to stay within the homes of family/friends/colleagues. Costs of transportation for business trips outside Zanzibar are also lower than for personal trips within Zanzibar.

**CHAPTER ELEVEN:
FOOD SECURITY AND NUTRITION**

11.1 Introduction

Food security exists when all people at all times have physical and economic access to sufficient, safe and nutritious food to meet their dietary needs and food preferences for an active and healthy life (FAO, 1996). Food security is widely classified under the four pillars food availability, food accessibility, food utilization and food stability. Food and nutrition security have emerged as primary development goals at the top of the global development agenda. In the year 2000, national governments adopted the UN Millennium Declaration known as the Millennium Development Goals (MDGs) in which it was stipulated to reduce by half, the proportion of people suffering from hunger by the year 2015. In the year 2015, the achievements and successes of the MDGs were taken up by the 17 Sustainable Development Goals (SDGs) adopted by the UN member states as a universal call to action to end poverty, protect the planet and ensure that all people enjoy peace and prosperity by 2030, with emphasis put on achieving “zero hunger” and eliminating all forms of malnutrition. In order to measure the progress and the achievements of the zero-hunger goal, the development of both statistical methodologies and different surveys for obtaining reliable estimates of food security situation and levels of undernourishment became an essential step. In view of this important step, since 2009/2010 the HBSs have been including a number of questions to capture information for analysing the food security situation at household level in Zanzibar using some of the global indicators.

11.2 Main Source of Household Food

Table 11.1 shows the proportion of households and the main sources of household food. The results revealed that generally 82.1 percent of the households depends largely on food purchasing. The proportion of households depending entirely on their own production as a main source of food is 11.2 percent while 4.1 percent of the households get their food mainly as gifts or food aid. With respect to individual food items, more than 91 percent of the households depend on food purchase of cereal products (rice, maize, wheat flour and millets), the same as legume crops, and only around 2.4 percent from their own production. Nearly 65.9 percent of the households depend on food purchase for the root crops (potato, sweet potatoes, yams and cassava), and only 26.3 percent from their own production. The main source of fruits and vegetables varies depending on the type of the fruit or vegetable whereas around 52.2 percent to 86.6 percent of the households depend on purchase and about one third (27.7 percent to 32.7 percent) of the households depends on their own production as shown in Table 11.1. These results reveal that Zanzibar households are net food purchasers and dependency on food purchase is higher for all categories of food products.

Zanzibar Household Budget Survey 2019/2020

Table 11.1: Percentage of Households by Main Source of Food in the Preceding Week, 2019/20 HBS

Type of food	Purchase	Own Production	Traded goods/Service, barter	Borrowed	Received as gift	Food aids	Others	Total

11.3 Usual Number of Meals in the households

The results in Table 11.2 show that the proportion of the households that consume three or more meals per day has decreased from 80 percent in 2014/2015 HBS to 67.0 percent in 2019/20HBS. Also, the proportion of the household that consume two meals has increased to almost twice from 18.6 percent in 2014/15 to 31.8 percent in 2019/20HBS. Furthermore, the proportion of households that consume one meal per day has slightly decreased from 1.4 percent in 2014/2015 HBS to 1.2 percent in 2019/2020 HBS. In the urban areas, the households that consume three meals has decreased from 86 percent in 2014/2015 HBS to 80.1 percent in the 2019/2020 HBS while that of the rural areas has decreased from 58.9 percent to 56.5 percent within the same periods. However, households that consume two meals have increased by 2 percent in the rural areas and also increased by 6 percent in the urban areas.

Table 11.2: Percentage of Households and Number of Meals per Day by Area, 2009/10, 2014/15 and 2019/20 HBS

Number of meals	2009/10			2014/15			2019/20

11.4 Proportion of Households Receiving Fewer Meals than Usual

Table 11.3 shows that the households that receive their usual number of meals have same trend between the two surveys with 69 percent in the 2014/2015 HBS and 2019/2020 HBS. The rest (30.4 percent) had received fewer meals within different periods. About a quarter of the households (23.3 percent) had fewer meals within one day to one week during the past 30 days, and 4.4 percent of the households had fewer meals within one to two weeks. Around 3 percent of the households had fewer meals for up to three weeks and nearly one in hundred households (0.7 percent) had fewer meals than normal for more than three weeks in the last 30 days.

In the urban areas, the proportion of household that received their usual number of meals decreased from 80.8 percent in 2014/15 HBS to 75.7 percent in the 2019/2020 HBS. Unlike the urban areas, the proportion of the households that received the usual number of meals in the rural areas in the last 30 days increased by 3.7 percentage points from 59.9 percent in 2014/15 HBS to 63.6 percent in 2019/20 HBS. However, the percentage of households that received fewer meals for more than three weeks in the past 30 days was higher in the rural areas than in the urban areas for both the 2014/2015 HBS and the 2019/2020 HBS as shown in Table 11.3.

Table 11.3: Percentage of Households that Had Fewer Meals Than Usual in the Last 30 Days by Number of Days and Area, 2009/10, 2014/15 and 2019/20 HBS

Number of Days	2009/10			2014/15			2019/20

Total Households	136,059	96,452	232,511	148,754	113,541	262,295	166,985	133,896	300,881

Table 11.4 presents the proportion of households that received meals categorized in districts. The results show that Mkoani district had only 46.3 percent of the households that received their usual number of meals, meaning that more than 50 percent of the households had fewer meals than usual, followed by Micheweni (49.6 percent), Kaskazini A (34.2 percent) and Kaskazini B (32.6 percent). Kusini district had the highest proportion (84.4 percent) of the households which had the usual number of meals in the last 30 days, followed by Magharibi B (78.6 percent), Chake Chake (73.6 percent) and Mjini (72.8 percent). Also, in Micheweni, Mkoani and Magharibi A, more than 4 percent of the households had fewer meals than normal within two to three

weeks during the past 30 days. Furthermore, in Wete, Magharibi A and Micheweni, at least one in hundred households had fewer meals than normal for more than three weeks during the past 30 days.

Table 11. 4 Percentage of Households That Had Fewer Meals than Usual in the Last 30 Days by Number of Days and District, 2019/20 HBS

District	None	1-7 days	8-14 days	15-21 days	22-30 days	Total percentage fewer meals	Total No. of Households	Households with fewer meals
Magharibi B	78.6	15.3	4.0	1.8	0.3	21.4	48,172	10,316
Chake Chake	73.6	19.2	4.1	3.0	0.0	26.4	20,179	5,326

Micheweni	50.4	31.5	8.2	6.7	3.2	49.6	23,248	11,531
Mkoani	46.3	32.1	14.5	6.6	0.5	53.7	20,874	11,208
Total	69.0	23.3	4.4	2.6	0.7	31.0	300,881	93,358

11.5 Food Consumption Score (FCS)

Food Consumption Score (FCS) is a proxy indicator of the household dietary diversity and nutrients intake measured in a seven-day recall period. The FCS is a composite score based on dietary diversity (food groups), food frequency, and relative nutritional importance (weight) of each food group. It is used to identify the most food insecure households. The results from the FCS are categorized into “Poor dietary intake”, “Borderline dietary intake” and “Accepted dietary intake”. These results provide essential information on the people’s current diets and is helpful in deciding the most appropriate type and scale of food security intervention, as well as, the right target group for food assistance. In view of that importance, the 2019/20 HBS used the FCS to assess food security in terms of diversity of the households’ food intake, as well as, for measuring the intake of specific nutrients - Vitamin A, Protein and Iron.

Table 11.5 shows the proportion of the households that fall within the three categories of Food Consumption Score (FCS), i.e., the poor consumption, the borderline and the acceptable consumption. The results indicated that 91 percent of the households consume diverse types of food and are in the Acceptable FCS category. About 7 percent are in borderline and the rest two percent of the households have poor dietary intake which is a proxy indicator of the poor nutritional status in those households.

Table 11.5: Households Food Consumption Score by Area, 2019/20 HBS (%)

FCS Categories	Mean FCS			Percentage out Total of Households	Total Number of Household
	Rural	Urban	Total		
Poor	68.7	31.3	61.5	2.0	6,006
Borderline	66.7	33.3	61.7	6.8	20,556
Acceptable	54.4	45.6	63.0	91.0	273,715
Not Stated	46.5	53.5	64.0	0.2	604
Total	58.65	68.54	63.05	100	300,881

The results in Table 11.6 show that urban areas have higher proportion of the households with acceptable food intake (93.2 percent) compared with 89.2 percent in the rural areas. Magharibi A, Mjini and Kusini districts have higher food consumption score and therefore better dietary diversity compared with the other districts. Districts that registered low food consumption score are Kaskazini B, Mkoani and Micheweni, with FCS values of 55.9 percent, 53.3 percent and 49.3 percent respectively, indicating the intake of nutritionally poor diet at general.

Table 11.6: Table 11.6: Households Food Consumption Score by Area and District, 2019/20 HBS

	Mean FCS	FCS Categories				Total No. of HHs
		Poor	Borderline	Acceptable	Not Stated	
Area						
Rural	58.65	2.5	8.2	89.2	0.2	166,985
Urban	68.54	1.4	5.1	93.2	0.2	133,896

Mkoani	53.27	4.5	11.0	84.5	0.0	20,874
Total	63.05	2.0	6.8	91.0	0.2	300,881

11.6 Frequency of Food Consumption by Food Item and Area in the Preceding Week

Table 11.7 presents the average number of days a particular type of food is consumed in the week preceding the survey. Overall, there is a clear difference in the frequency of consumption of the various food types with cereals and grains, sugar, condiments and some of the vegetables consumed for more than five days a week. However, orange coloured fruits, orange coloured vegetables and green leafy vegetables (rich in vitamin A) are each consumed for less than 4 days a week. Meat products, together, are consumed for 3 days per week while fish is consumed for almost 5 days per week. Consumption of eggs and dairy products including fresh milk is consumed for less than 3 days in a week. Furthermore, the results indicated that there is no considerable difference in the consumption pattern between the urban and rural communities.

Table 11.7: Mean Frequency of Food Consumption by Food Item and Area in the Preceding Week, 2019/20 HBS

Type of Food Item	Rural	Urban	Total
Cereals and grain: Maize, rice, sorghum, millet, bread	5.3	5.4	5.4
Roots and tubers: potato, yam, cassava, sweet potato or other tubers	3.4	3.9	3.6
Legumes/nuts: beans, cowpeas, peanuts, lentils, nut, soy, pigeon peas and / or other nuts	2.0	2.1	2.0
Orange vegetables: carrot, pumpkin, orange sweet potatoes,	3.1	3.8	3.5
Green leafy vegetables: spinach, amaranth and / or dark greed	2.1	2.4	2.3
Other vegetables: onion, tomatoes, cucumber, green beans,	5.0	5.2	5.1
Orange fruits (rich in Vitamin A): Mango, papaya	3.0	2.6	2.8
Other fruits: banana, guava, orange, lemon, tangerine	3.1	2.9	3.0
Meat: goat, beef, chicken, pork (meat in large quantities and not as condiments)	1.7	2.1	2.0
Liver, kidney, heart and / or other organ meats	1.3	1.5	1.5
Fish: fish and dagaa (fish in large quantities and not as condiments)	4.7	4.5	4.6
Eggs	1.6	2.0	1.8
Milk and other dairy products: fresh milk / sour, yogurt, other dairy products	2.8	2.8	2.8
Oil/fat/butter: vegetable oil, palm oil, margarine, other fats / oil	2.7	3.4	3.1
Sugar, or sweet: sugar, honey, candy and other sweet (sugary drinks)	6.1	5.6	5.9
Condiments/Spices: tea, coffee /cocoa, salt, garlic, spices, yeast / baking powder, tomato sauce, meat or fish as condiment, condiments including small amount of milk / tea coffee	6.7	6.6	6.7
Total	4.1	4.0	4.0

11.7 Frequency of Food Consumption by Food Groups, Area and Districts in the Preceding Week

Grouping of food items that have similar caloric and nutrient content provides a true picture of the household's consumption pattern as opposed to using the individual food items. Table 11.8 presents the weekly consumption (in number of days) of the 9 food groups by area and districts as used in the analysis of the Food Consumption Score. In both urban and rural areas, three groups – 'main staples', 'vegetables' and, 'meat and fish', are consumed seven days a week followed by condiments and sugar. Consumption of fruits ranges from 5 days in the urban areas to 6 days in the rural areas, oil is 2.7 days in the rural areas and 3.4 days in the urban areas, while milk is the same in the urban and rural areas (2.8 days per week). The results for food groups consumption across districts are almost similar to that of the rural and urban areas.

Table 11.8: Frequency of Food Consumption by Food Groups, Area and Districts in the Preceding Week, 2019/2020 HBS

Area	Main	Pulses	Vegetables	Fruits	Meat and	Milk	Sugar	Oil	Condiments
Rural	7.0	2.0	7.0	6.0	7.0	2.8	6.1	2.7	6.7
Urban	7.0	2.1	7.0	5.0	7.0	2.8	5.7	3.4	6.0
Districts									
Kaskazini A	7.0	2.1	7.0	7.1	7.0	2.6	6.4	2.1	6.7
Kaskazini B	7.0	2.1	7.0	5.9	7.0	2.3	6.0	2.7	6.6
Kati	7.0	2.2	7.0	6.7	7.0	2.9	5.8	3.6	6.9
Kusini	7.0	2.0	7.0	5.8	7.0	2.5	6.0	3.1	6.9
Mjini	7.0	2.1	7.0	5.0	7.0	2.7	5.6	3.5	6.5
Magharibi A	7.0	2.1	7.0	6.4	7.0	2.9	6.0	3.5	6.8
Magharibi B	7.0	1.9	7.0	5.1	7.0	2.5	5.1	3.2	6.6
Wete	7.0	1.7	7.0	5.0	7.0	3.0	6.3	2.4	6.8

Chake Chake	7.0	2.1	7.0	6.3	7.0	2.8	6.6	2.7	6.9
Mkoani	7.0	1.9	7.0	5.6	7.0	3.5	6.5	2.0	6.8
Average	7.0	2.0	7.0	5.8	7.0	2.8	5.9	3.1	6.7

11.8 Consumption of Food items Rich in Vitamin A, Protein and Iron

Table 11.9 shows the results for the consumption of food items rich in vitamin A, protein and iron, normally known as Food Consumption Score for Nutrition (FCS-N). More than 80 percent of the households consume vitamin A rich food on daily basis, around 15 percent have vitamin A food irregularly (only in some of the days) in a week and 1.3 percent never consume any vitamin A rich food for the whole week preceding the survey. Protein consumption on daily basis is only within 64.8 percent of the households while iron rich food was found to be in the daily diet of only 33 percent of the households at national level. Furthermore, the urban areas had higher daily intake of vitamin A, protein and iron rich foods than the rural areas.

Table 11.9: Percentage of Household by Nutrients Consumption (FCS_N) and Area, 2019/2020 HBS

Type of Nutrient	Frequency of Consumption	Rural	Urban	Total
Vitamin A rich food	Never consumed	1.7	0.8	1.3
	Consumed sometimes	18.5	9.8	14.8
	Consumed at least daily	79.6	89.2	83.6
	Not stated	0.2	0.2	0.2

CHAPTER TWELVE
GENDER AND TIME USE

12.1 Gender**12.1.1 Introduction**

This chapter presents gender statistics from education, employment, ownership and decision-making based on gender issues from the 2019/2020 HBS. This chapter includes some crucial gender indicators related to the Sustainable Development Goals and other indicators which are useful for the purposes of planning, policymaking and gender mainstreaming.

12.1.2 Education

Literacy is the ability to read and write even a small sentence in any language of choice. It is essential for social and human development and provides individuals with skills and empowers them to transform their lives and improve their standard of health and ability to earn a higher income.

In general, the gender distribution among those who knows Swahili only and, Swahili and English are equal between women and men. Similarly, in urban areas, there are equal distribution of men and women who know Swahili and English, while in the rural areas, the situation is a bit different with more men who know both languages than women (Table 12.1).

Table 12. 1 Percentage of Population Aged 15 Years and Above by Literate in Any Language by Sex, 2019/20 HBS

Literacy	Rural			Urban			Total		
	Women	Men	Total	Women	Men	Total	Women	Men	Total
Swahili	48.0	52.0	100.0	56.0	44.0	100.0	50.0	50.0	100.0
Swahili and English	49.0	51.0	100.0	50.0	50.0	100.0	50.0	50.0	100.0
Other language	44.0	56.0	100.0	34.0	66.0	100.0	40.0	60.0	100.0
Not able	64.0	36.0	100.0	77.0	23.0	100.0	67.0	33.0	100.0
Total	252,147	239,714	491,861	236,900	213,030	449,930	489,047	452,744	941,791

At the district level, majority of the literate women resided in Mjini and Magharibi B while the majority of the literate men resided in the other districts. Additionally, the percentage of illiterate women was higher compared to illiterate men (66.5 percent and 33.5 percent respectively), and this observation is true for all the districts across Zanzibar.

Table 12. 2 Percentage of Population Aged 15 Years and Above and Literate in Any Language by Sex and District, 2019/20 HBS

District	Literate				Illiterate			
	Women	Men	Total %	Total number	Women	Men	Total %	Total number
Kaskazini A	50.0	50.0	100	61,177	64.7	35.3	100	14,215

Mkoani	48.5	51.5	100	47,426	62.5	37.5	100	17,158
Total	49.8	50.2	100	823,556	66.5	33.5	100	118,235

Formal education is an education normally delivered by trained teachers in a systematic and intentional way within a school, higher education or university having a proper syllabus while **non-formal education** refers to education that occurs outside the formal school system such as adult education.

The total population aged 15 years and above was 941,791 and 110,553 did not attend formal education. Among those who did not attend formal education, about seven out of ten of them (69 percent) are women. Apart from Forms 1 to 6 and Diploma level, more men have attained all the other educational levels compared to women.

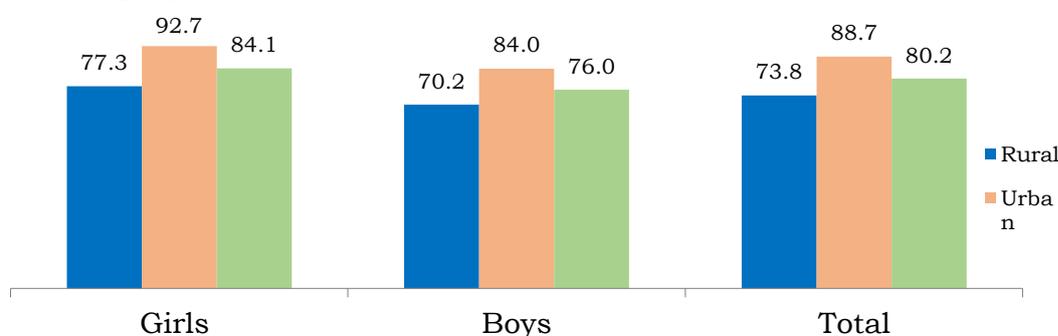

Table 12.3 Percentage of Population Aged 15 Years and Above by Highest Level of Education Achieved by Sex, 2019/20 HBS

Highest level of education achieved	Women	Men	Total
No formal Education	69.4	30.6	110,553
Pre-school	44.9	55.1	447
Adult/alternative education	25.2	74.8	2,986
Primary 1 – 8	46.3	53.7	247,016

12.1.3 Participation Rate in Organized Learning (one year before the official primary entry age)

This indicator is defined as the percentage of children in the given age range who participate in one or more organized learning programme, including programmes which offer a combination of education and care. The official pre-primary entry age is the age at which children are obliged to start pre-primary education according to national legislation or policies. Zanzibar Education Policy (2016) explained all children aged 4 to 5 year should start pre -primary education. Figure 12.1 shows the participation rate in organized learning one year before the official primary entry ages. The results revealed that in both rural and urban areas, the participation in organized learning was higher for girls than for boys. Moreover, the participation rate in organized learning was higher in urban areas (88.7 percent) than in rural areas (73.8 percent).

Figure 12.1: Participation Rate in Organized Learning One Year Before the Official Primary Entry Age by Location and Sex, 2019/20 HBS

At the district level, it can be observed from Table 12.4 that Kusini district had the highest participation rate in organized learning for children aged 5 years where almost all children at that age (both boys and girls) are attending school, followed by Magharibi B district with 96.8 percent for girls and 91.3 percent for boys. The district with the lowest participation rate in organized learning was Micheweni district with 49.6 percent for girls and 51.1 percent for boys.

Table 12.4: Participation Rate in Organized Learning One Year Before the Official Primary Entry Age by District, 2019/20 HBS

District	Girls	Boys
Kaskazini A	88.6	77.2
Kaskazini B	82.8	69.3
Kati	88.7	92.6
Kusini	99.0	99.0
Mjini	92.1	84.2
Magharibi A	87.7	76.4
Magharibi B	96.8	91.3
Wete	81.1	58.9
Micheweni	49.6	51.1
Chake Chake	68.3	70.3
Mkoani	81.4	64.6
Total	84.1	76.0

12.1.4 Participation Rate of Youth and Adult in Formal and Non-Formal Education and Training by sex

The indicator is defined as the percentage of youth and adults in a given age range (15-35 years) participating in formal or non-formal education or training in a given time period.

The results from Table 12.5 reveal that the total participation rate of youth aged 15-35 years (Tanzania youth definition) participating in formal, non-formal education and training was 94.8 percent for women and 97.3 percent for men. Majority of youth participated in formal education where the rate for women was 93.9 percent and the rate for men was 96.0 percent. The participation rate was higher for men than women both in rural areas (92.9 percent women and 95.8 percent men) and urban areas (96.7 percent women and 98.9 percent men). The participation rate in training is about one percent for both women and men and similarly in rural and urban areas.

Table 12.5: Participation Rate of Youth Age 15-35 by Categories, Location and Sex, 2019/20 HBS

Categories of Education	Sex	Rural	Urban	Total
Formal	Women	92.2	95.7	93.9
	Men	95	97.2	96
Non-formal	Women	0	0	0
	Men	0.1	0.2	0.2
Training	Women	0.7	1	0.9
	Men	0.7	1.5	1.1
Total	Women	92.9	96.7	94.8
	Men	95.8	98.9	97.3

The results (Table 12.6) show that Kusini district had the highest proportion of youth aged 15-35 participating in education (99.2 percent), with the rate for men (99 percent) marginally higher than the rate for women (98.5 percent). Micheweni district had the lowest participation rate (86.4 percent) among all the districts, with the participation for women at 84.0 percent and men at 88.8 percent. Very few youths participated in non-

formal education for both women and men in all districts. There were more men in training than women although the difference is marginal.

12.1.5 Proportion of population in a given age group achieving at least a fixed level of proficiency in functional (a) literacy and (b) numeracy skills by Sex; 2019/20

This indicator is a direct measure of the skill levels of the general population in the two areas of literacy and numeracy. Table 12.7 shows that the total proportion of the population who achieved a fixed level of proficiency in literacy was 58.7 percent, with the proportion of women (59.2 percent) slightly higher than men (58.3 percent). The age group of 56-65 years have maximum proportion (69.6 percent) and the proportion of women was 58.8 percent and 76.5 percent for men. This is followed by age group of 36-45 years with a proportion of 67.7 percent of which 63.0 percent were women and 62.9 percent were men. The results generally indicated that across the younger age groups (from less than 18 to 35 years), a higher proportion woman achieved fixed level of proficiency in functional literacy skills compared to the older age groups from 36 to 65+ years.

Table 12.7: Proportion of Population who Achieved at Least a Fixed Level of Proficiency in Functional Literacy Skill by Age Group and Sex, 2019/20 HBS

Age group	Women	Men	Total
Less than 18	55.8	52.6	54.2
18 - 25	68.2	52.4	59.5
26 - 35	70.8	62.9	67.3
36 - 45	63.0	72.3	67.7
46 - 55	56.1	65.9	60.8
56 - 65	58.8	76.5	69.6
66+	53.7	71.3	65.2
Total	59.2	58.3	58.7

At the district level, Kusini district had the highest proportion of the population who achieved fixed level of literacy (68.2 percent), followed closely by Magharibi A (67.3 percent), Kati (65.1 percent), with Wete having the lowest proportion in this regard. Furthermore, Kusini, Mjini and Mkoani had more men who achieved at least a fixed level of proficiency in functional literacy skills, while women achieved more in the remaining districts (Table 12.8).

Table 12.8: Proportion of Population who Achieved at Least a Fixed Level of Proficiency in Functional Literacy Skill by District and Sex ;2019/20

District	Women	Men	Total
Kaskazini A	65.1	56.2	60.1

Micheweni	55.6	50.4	52.9
Chake Chake	54.0	51.5	52.6
Mkoani	59.2	65.4	62.6
Total	59.2	58.3	58.7

Table 12.9 shows that the proportion of the population who achieved a fixed level of proficiency in numeracy skill was 84.5 percent, with no marked difference between men and women. In the younger age groups of less than 18-25 years, more women achieved a fixed level of proficiency in numeracy skill than men. In the remaining age groups however, more men achieved a fixed level of proficiency in numeracy skill than women.

Table 12.9: Proportion of Population who Achieved at Least a Fixed Level of Proficiency in Functional Numeracy Skill by Age Group and Sex ;2019/20

Age group	Women	Men	Total
Less than 18	84.4	81.2	82.8

56 - 65	77.4	90.8	85.6
66+	70.4	88.3	82.1
Total	84.8	84.1	84.5

At the district level, it can be observed in Table 12.10 that Kusini (97.3 percent), Mjini (90.8), Kati (90.6), Magharibi B (90.1 percent) were the districts with the highest proportion of their population achieving at least a fixed level of proficiency in functional numeracy skill with no considerable difference between men and women. The Micheweni district had the lowest proportion of its population achieving at least a fixed level of proficiency in functional numeracy skill. Furthermore, across all the districts, there appears to be no marked difference in the proportion of men and women achieving at least a fixed level of proficiency in functional numeracy skill (Table 12.10).

Table 12.10: Proportion of Population who Achieved at Least a Fixed Level of Proficiency in Functional Numeracy Skill by District and Sex; 2019/20

12.1. 6 Employment

Employment is the situation where a person is having a job, either a paid job or as a self-employed. Employment is an important part of the economic, social and environmental development process of any country. Employment provides financial freedom and decision-making power.

The employed persons observed from this survey totaled 577,751, and it was found out that among the employed persons, there were more men (58.6 percent) than women (41.4 percent). Over three-quarter of the employed (36.2 percent) were engaged within the agriculture, forestry and fishing industry, where there were more men (58.5 percent) than women (41.5 percent). Additionally, more women were employed in these industries than men – manufacturing, accommodation and food service activities, education, human health and social work activities, activities of households as employers; undifferentiated good, and other service activities.

Table 12.11: Sex Distribution of Employed Persons by Industry, 2019/20 HBS

Industry	Women	Men	Total
Agriculture, forestry and fishing	41.5	58.5	208,945
Mining and quarrying	34.5	65.5	4,472
Manufacturing	55.1	44.9	55,224

Public administration and defense; compulsory social security	31.9	68.1	25,966
Education	60.3	39.7	23,444
Human health and social work activities	50.6	49.4	10,277
Arts, entertainment and recreation	49.8	50.2	2,605
Other service activities	57.4	42.6	18,931
Activities of households as employers; undifferentiated good	84.8	15.2	7,781
Total	41.4	58.6	577,751

An occupation is a work of a person who has a specific field of interest and distinct skills that benefit that field. From the 2019/20 HBS, all occupations were dominated by men, with women constituting 37.9 percent of the employed persons while 62.1 percent were men. Despite a higher proportion of men than women across all the occupation categories, it is worth noting that the difference between the proportion of men and women in the following occupations is very marginal – Technicians and associate professionals, Clerks, Service workers and shop sales workers, and Elementary occupations.

Table 12.12: Sex Distribution of Employed Persons by Occupation and Sex, 2019/20 HBS

Occupation	Women	Men	Total
Legislators, administrators and managers	22.3	77.7	6,943
Professionals	39.9	60.1	16,746
Technicians and associate professionals	48.3	51.7	31,299

Skilled agricultural and fishery workers	39.4	60.6	167,312
Craft and related workers	31.7	68.3	77,222
Plant and machine operators and assemblers	3.1	96.9	11,671
Elementary occupations	46.6	53.4	131,011
Total	41.4	58.6	577,751

12.1.7 Unemployed persons

Unemployment is often used as a measure of the health of the economy. During unemployment, there is no income, which leads to poverty, burden of dependency and economic problems. In Table 12.13, it can be

observed that out of a total of 125,201 unemployed persons, close to three-quarter of them were women (73.5 percent) compared to men (26.5 percent). Most of the unemployed persons fall within the age group of 20-24 years, with this group accounting for more than one-third of the unemployed persons. Furthermore, apart from the age group of 65 to 74, a higher proportion of women were unemployed across all the age groups compared to men.

Table 12.13: Sex Distribution of Unemployed Persons by Age group and Sex, 2019/20 HBS

Age group	Women	Men	Total number
15-19	57.0	43.0	22,611
20-24	64.2	35.8	40,268
25-29	78.7	21.3	23,751
30-34	92.7	7.3	13,133
35-39	96.7	3.3	7,874

45-49	88.9	11.1	3,474
50-54	94.9	5.1	3,597
55-59	82.6	17.4	2,628
60-64	55.5	44.5	1,478
65-69	46.5	53.5	1,088
70-74	42.7	57.3	404
80-84	100	0	213
Total	73.5	26.5	125,201

12.1.8 Unemployed Persons by Education Level

The level of education of the highest percent of unemployed persons was those who completed Forms 1-4 for both women and men with 62.1 percent and 64.9 percent respectively. The second level was those who completed Primaries 1-8 and the lowest being those with Adult/Alternative education. The sex distribution of the unemployed persons who completed university level was 74.7 percent for women and 25.3 percent for men.

Table 12. 14: Distribution of Unemployed Persons by Education Level, 2019/20 HBS

12.1.9 Information and Communication Technologies

Information and Communication Technologies (ICTs) refers to all communication technologies, including the internet, wireless networks, cell phones, computers, software, middleware, video-conferencing, social networking, and other media applications and services.

The results in Figure 12.2 reveal that more users of computer/tablets resided in the urban areas compared to the rural areas. Furthermore, the usage of computer/tablets was higher among men than women in both the rural and urban areas of Zanzibar.

Figure 12.2: Proportion of Population who Used Computer or Tablet by Location and, Sex, 2019/20HBS

The usage of computer/tablets is highest among the age ranges 18 to 35 years, and lowest for those over the age of 65 years. Across all the age groups, the usage of ICTs is higher among men than women.

Table 12.15: Proportion of Population who Used Computer or Tablet by Age group and Sex, 2019/20 HBS

Age group	Women	Men	Total
Less than 18 years	3.1	3.5	3.3

18+	13.2	18.5	15.7

At the district level, Magharibi B district had the highest proportion of the population who used computer or tablet with 17.7 percent for women and 24.5 percent for men, followed by Mjini district with 15.3 percent for women and 21.0 percent for men. The results show that, all districts have less proportion of women who use computer or table than to men (Table 12.16).

Table 12.16: Proportion of Population who Used Computer or Tablet by District and Sex, 2019/20 HBS

12.1.10 Proportion of Population who use the Internet

The Internet is a very important tool in the current environment that makes it easy to send or receive information. Basically, the internet is a great way to connect with the entire world. Majority of people use the internet as a way to connect with other people, sharing information, sharing of files, for entertainment, socializing, etc.

The proportion of the population who used the internet over the past 3 months were 16.8 percent. The proportion of women was 13.8 and 20.0 percent for men. More men and women living in the urban areas used the internet than in the rural areas but the results also show that more men used the internet than women in both rural and urban areas (Figure 12.3).

Figure 12.3: Proportion of Population who Used Internet Over the Past 3 Months by Location and Sex, 2019/20 HBS

The younger ages of 18-25 years were more users of internet (35.8 percent) over the past 3 months before the survey, where the proportion of women in that age group were less compared to men (27.0 percent and 45.7percent respectively). This was followed by the age group of 26 to 35 years with 34.2 percent of the total users of internet. Overall, 22.0 percent of women aged 18+ years and 32.5 percent of men of the same age group used internet (Table 12.17).

Table 12.17: Proportion of Population who Used the Internet Over the Past 3 Months by Age Group and Sex, 2019/20 HBS

Age group	Women	Men	Total
Less than 18 years	1.5	3.3	2.4

15 - 35	24.6	36.6	30.3
18+	22.0	32.5	27.0

The results in Table 12.18 show that Magharibi B district had the highest proportion of population who used the internet (28.5 percent), with the proportion of women (25.0 percent) and men (32.4 percent), followed by Mjini district with 21.2 percent for women and 29.8 percent for men. All the districts had smaller proportion of women users of the internet than men users of the internet.

Table 12.18: Proportion of Population who Used the Internet Over the Past 3 Months by District and Sex, 2019/20 HBS

The use of internet is directly proportional to the education level from the 2019/20 HBS. University graduates constituted the most users of the internet (90.3 percent), followed by graduates with Other certificates (75.9 percent) and those with adult education only constituting the least users of the internet. Generally, more men used the internet than women from the 2019/20 HBS across all the educational levels.

Table 12.19: Proportion of Population who Used the Internet Over the Past 3 Months by Education Level and Sex, 2019/20 HBS

12.1.12 Ownership of Resources

Ownership refers to the ultimate and exclusive rights and control over property that have been conferred by a lawful claim or title. This property may be an object, land, real estate or intellectual property. They are usually owned by women alone, men alone or both women and men.

The proportion of households by which the dwelling they were living in was owned by women alone was 20.9 percent, where those owned by men alone was 75.3 percent. The proportion of dwelling by which both women and men together owned the dwelling is just 3.4 percent. A larger percentage of women living in urban areas have more ownership of their homes than women living in rural areas (Figure 12.4).

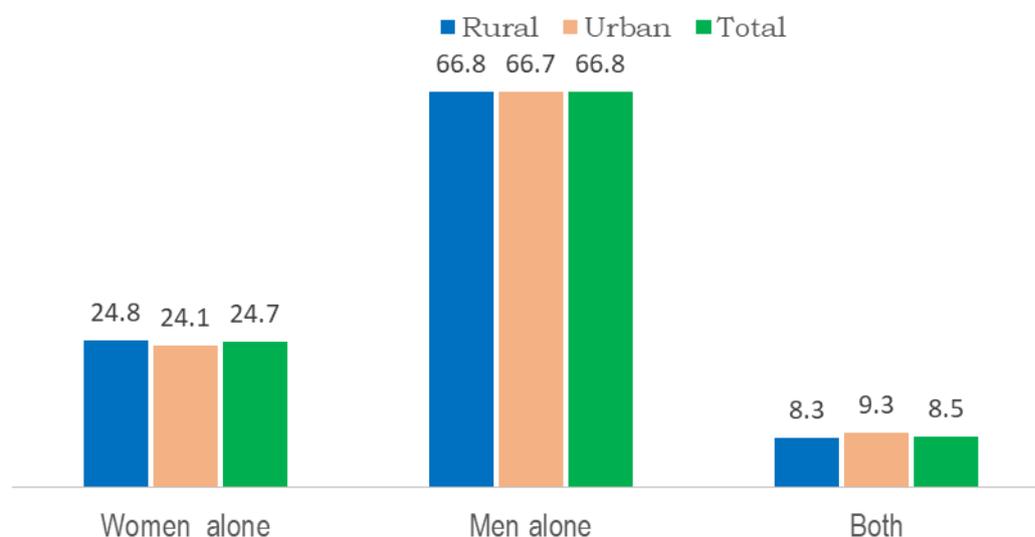

Figure 12.4: Proportion of Household who Owned Dwelling by Location and Sex, 2019/20 HBS

12.1.13 Secure Right of Agricultural Land

Among the households who reported that they have secured the right to an agricultural land, only 24.7 percent were women alone and 66.8 percent were men alone. The proportion who secured agricultural land together (both women and men) was about 8 percent. The proportion of women who had the secured right to agricultural land alone were fewer compared to men in both the rural and urban areas of Zanzibar (Figure 12.5).

Figure 12. 5: Proportion of Population who Secured Right to Agricultural Land by Location and Sex, 2019/20 HBS

At the district level, the Kaskazini A district had the highest proportion of women who secured the right to agricultural land alone (41.6 percent), followed by Micheweni (28.9 percent), with Mjini district having the lowest proportion of women who secured the right to agricultural land alone. Across all the districts, more proportion of men secured the right to agricultural land alone than women. Furthermore, the Micheweni district had the highest proportion of both men and women who together secured the right to agricultural land (17.3 percent), followed by Mjini (16.7 percent), with Kusini having the lowest proportion in this regard (Table 12.20).

Table 12.20: Proportion of Population who Secured Right to Agricultural Land by District and Sex, 2019/20 HBS

	Women alone	Men alone	Both	Total
Kaskazini A	41.6	52.0	6.4	100
Kaskazini B	15.9	78.8	5.3	100

Total	24.7	66.8	8.5	100

12.1.14 Decision Making

Decision making is the process of making choices by identifying a problem, gathering information, and assessing alternative resolutions to the problem. Using a step-by-step decision-making process can help to make more deliberate, thoughtful decisions by organizing relevant information and defining alternatives solutions. The results (presented in Figure 12.6) show that most men make decisions on the use of income from agriculture or livestock without the involvement of women.

The proportion of women who make final decision alone on spending farming income was 23.6 percent but 58.1 percent for men. A similar pattern was observed for men and women in both rural and urban areas. In the same vein, a higher proportion of males (54.5 percent) make final decision on spending livestock income than women (25.4 percent). Across Zanzibar, the rural and urban areas, a very small proportion of men and women both make the final decision to spend farming or livestock income together.

Figure 12.6: Proportion of Persons who Make Final Decision on Spending Agricultural Income by Location and Sex, 2019/20 HBS

Kaskazini A district had the highest proportion of women who make final decision alone regarding the spending of farming income (36.8 percent), followed by Micheweni district (28.6 percent) and Chake Chake district (27.7 percent). For men in this regard, the Magharibi B district had the highest proportion (73.7 percent), followed by Mkoani district (69.2 percent) and Kusini district (69.1 percent) who make final decision alone regarding the spending of farming income (Table 12.21).

The highest proportion of women who make final decision regarding spending of livestock income resided in Chake Chake district (31.1 percent), followed by Micheweni district (30.3 percent) and Mkoani district (27.7 percent). Finally, for men, Mjini district had the highest proportion (83.8 percent), followed by Kusini district (66.3 percent) and Magharibi A district (64.4 percent) who make final decision alone regarding the spending of livestock income (Table 12.21).

12.2 TIME USE

12.2.1 Introduction

This section presents the distribution of average time spent on all activities in 24 hours and participation of individuals in these activities, including the gender difference in unpaid care works and household work. The information has been disaggregated by sex, residence, region, age and marital status. The Table 12.22 shows the classification of System of National Account (SNA) with the main classifications of productive and non-productive activities.

Table 12.22: Activity Classification System

Main Classification	SNA Categories		Major Division
Productive	Activities within SNA boundary	1	Employment and related activities
		2	Production of goods for own final use
	Non-SNA production	3	Unpaid domestic services for household and family members
		4	Unpaid caregiving services for household and family members
		5	Unpaid volunteer, trainee and other unpaid work
Non-Productive	Personal activities	6	Learning
		7	Socializing and communication, community participation and religious practice
		8	Culture, leisure, mass media and sports practices
		9	Self-care and maintenance

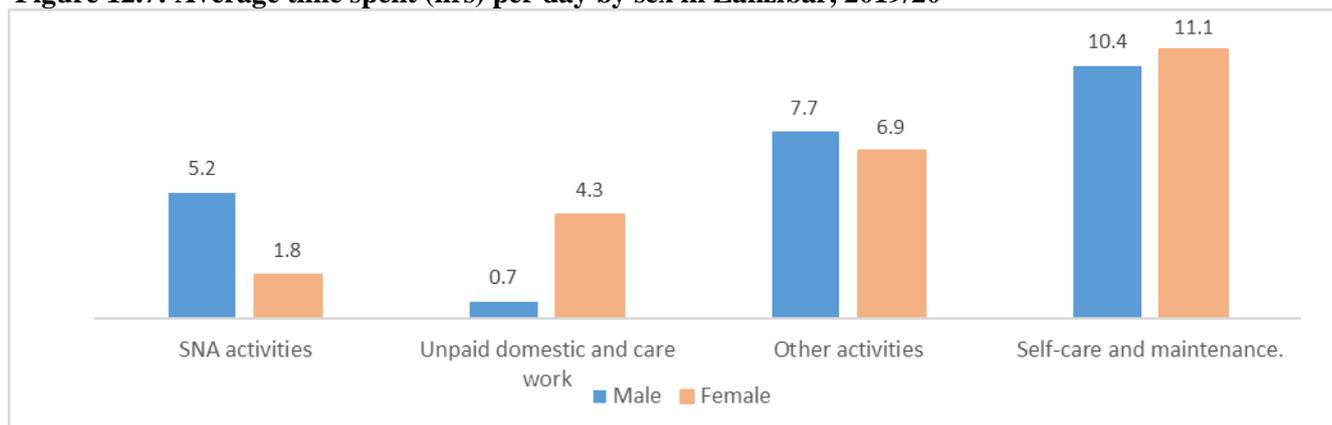

12.2.2 Average Time Spent by Sex

The results in Table 12.23 show that an average of 3.4 hours was spent (14 percent of total hours) doing SNA activities while an average of 10.7 hours was spent doing self-care maintenance activities like sleeping, eating & drinking, personal hygiene & care, receiving personal health care, travels related to self-care & maintenance and other self-care and maintenance. On average, males spent on average more time (5.2 hrs) in doing SNA activities compared to females (1.8 hrs). On the other hand, females spent about five times on average doing unpaid work (4.3hrs) compared to males (0.7 hrs) per day. Self-care and maintenance activities for the population aged 15 years and above were not found to be considerably different between males and females (10.4 hrs and 11.1 hrs respectively).

Table 12.23: Mean time spent by the population of age 15 years and above per day (24 hours) by activity and sex

	Average Time Spent			Percentage

Figure 12.7: Average time spent (hrs) per day by sex in Zanzibar, 2019/20

12.2.3 Average Time Spent by Sex and Residence

The population aged 15 years and above who are living in rural areas spent more time (3.6 hrs) in doing SNA activities compared to their urban counterpart (3.2hrs), although the difference is marginal. There is a gap in unpaid domestic and care work whereby rural population spent more time (2.8hrs) compared to urban population (2.4hrs). However, the time spent in self-care and maintenance is almost the same between the urban and rural population.

Table 12.24: Mean time spent by the population of age 15 years and above per day (24 hours) by activity and Location

SNA Activities	Rural			Urban		
	Male	Female	Total	Male	Female	Total
SNA activities	5.3	2.0	3.6	5.0	1.6	3.2

9. Self-care and maintenance.	10.4	11.2	10.8	10.4	11.0	10.7
Total	24.0	24.0	24.0	24.0	24.0	24.0

12.2.4 Average Time Spent by Sex and District

Table 12.25 reveals that the population aged 15 years and above who are living in Kaskazini A, Kaskazini B and Kusini districts are leading in doing SNA activities whereby Kaskazini B spent 4.3hrs, Kusini and Kaskazini A population spent 4.2hrs each. The population with the least hours was observed in Chake Chake (2.4 hrs). With respect to unpaid domestic and care work, Micheweni district is leading with females in this district spending 5.3 hrs compared to males with 1.7 hours per day. Generally, across all the districts, males spent considerably more time than females for all the activity categories.

Table 12.25: Mean time spent by the population of age 15 years and above per day (24 hours) by activity and District

District	SNA activity			Unpaid domestic and care work			Other activities			Self-care and maintenance		
	Male	Female	Total	Male	Female	Total	Male	Female	Total	Male	Female	Total
Kaskazini A	6.3	2.4	4.2	0.6	4.3	2.6	7.1	6.3	6.7	10.0	11.0	10.5
Kaskazini B	6.6	1.9	4.3	0.8	4.8	2.7	6.8	6.8	6.8	9.9	10.5	10.2
Kati	5.6	2.2	3.9	0.5	4.2	2.4	7.5	6.6	7.1	10.4	11.0	10.7
Kusini	5.9	2.4	4.2	0.4	4.4	2.5	7.3	6.4	6.8	10.4	10.8	10.6
Mjini	4.6	1.4	2.9	0.5	3.7	2.2	8.7	8.2	8.5	10.2	10.7	10.5
Magharibi A	5.3	1.4	3.2	0.5	4.2	2.5	7.9	7.5	7.7	10.3	10.9	10.6
Magharibi B	5.9	2.0	3.8	0.7	4.4	2.7	7.3	6.9	7.1	10.0	10.6	10.4
Wete	3.8	1.8	2.7	1.0	4.4	2.8	8.2	6.1	7.1	11.0	11.7	11.4
Micheweni	5.6	2.2	3.7	1.6	5.1	3.6	6.3	5.2	5.7	10.5	11.5	11.0
Chake Chake	3.5	1.5	2.4	1.0	4.1	2.6	7.8	6.2	6.9	11.8	12.3	12.0
Mkoani	4.4	1.7	3.0	1.0	4.5	2.9	8.1	6.2	7.1	10.5	11.6	11.1

The Table 12.26 shows the mean time spent by SNA activity category for every district. The results show that the Micheweni population aged 15 years and above spent more time in doing Non-SNA productive activities which are unpaid activities where females spent about three times compared to males. For non-productive activity, Chake Chake and Mjini districts are leading compared to the other districts. This group includes leanings, socializing, culture, leisure, mass media and sports practices, self-care and maintenance.

Table 12.26: Mean time spent by the population of age 15 years and above per day (24 hours) by SNA category activity and District

District	SNA activity			Non-SNA activities (productive)			Non productive		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
Kaskazini A	6.3	2.4	4.2	0.7	4.5	2.8	17.0	17.1	17.1
Kaskazini B	6.6	1.9	4.3	0.9	5.0	2.9	16.5	17.1	16.8
Kati	5.6	2.2	3.9	0.8	4.5	2.6	17.6	17.4	17.5

Mkoani	4.4	1.7	3.0	1.1	4.5	2.9	18.5	17.8	18.1

12.2.5 Average Time Spent by Sex and Age Group

The comparison of the time spent on different activities by age groups shows that the population aged 35-64 years spent more hours (4.6hrs) in doing SNA activities, followed by population aged 25-34 years who spent 3.7hrs out, with the elderly (65 years and above) spending 2.4hrs. Unpaid domestic and care work were normally done by the population aged 25-34 years which is dominated by females. Those aged 65 years and above recorded the highest amount of time spent on self-care and maintenance compared to the other age groups.

Table 12.27: Mean time spent by the population of age 15 years and above per day (24 hours) by activity and Age group.

SNA Activities	15-24			25-34			35-64			65+

Total	24.0											

12.2.6 Average Time Spent by Sex and Marital Status

The Table 12.28 demonstrates that females and males of age 15 years and above who are married or living together with spouses spent more time per day on SNA activities (4.1hrs per day) in relation to the other categories of marital status. Also, married females spent more time doing unpaid domestic care work (5.1hrs) compared to females in other categories of marital status. The majority of never married population spend their time (9hrs) in doing other activities which includes learning, socializing, communication, community participation, culture, leisure, mass media, religious and sports practices.

Table 12.28: Average time spent per day (24 hrs) by activity and marital status (hrs), age 15+ years

12.2.7 Total Time Spent (per year) for Unpaid Domestic and Care Works

The Figure 12.8 highlights the total time spent in a year for unpaid domestic and care work which are not accounted for within the system of national accounts. The results reveal that 829 million hours were spent for unpaid domestic and care works annually in Zanzibar which represents about 10 percent of the total time. It was also found that females spent 718.8 million hours annually (86.7 percent) for unpaid domestics and care

works compared to 110.3 million hours males (13.3 percent). The results showed that the unpaid domestic and care works was mostly done by women.

Figure 12. 8 Total time spent per year for unpaid care works by sex in Million hrs

**CHAPTER THIRTEEN:
INTERNAL MIGRATION**

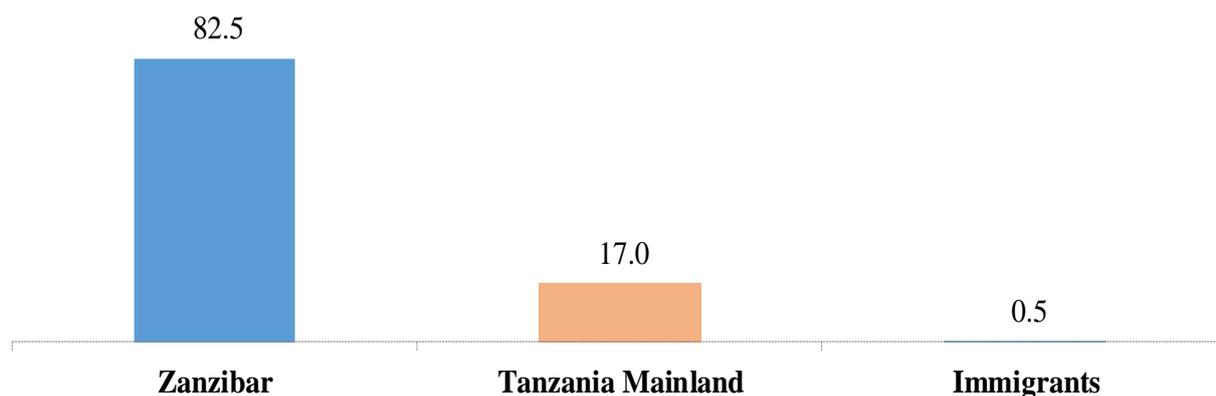

13.1 Introduction

This chapter mainly discusses the status of internal migration in Zanzibar. It presents information for both current migration (i.e. one year preceding the survey) and life time migrated population (i.e. place of birth). It also provides information on the regional and district index of representation and internal migration flows.

13.2 Population and Migration

A total population of 1,625,589 was estimated in Zanzibar from 2,788 interviewed household during the 2019/20 HBS. Out of this total population, 25.4 percent were migrants (equivalent to 412,900) and 76 percent are non-migrants (equivalent to 1,212,319). Figure 13.1 shows that among the migrants, 83 percent were internal migrants between Zanzibar regions or districts at a particular point in their life, 17 percent were intra-migrants from Tanzania Mainland to Zanzibar and only less than one percent were immigrants currently residing in Zanzibar.

Figure 13.1: Proportion of Migrants in Zanzibar, 2019/20 HBS

13.3 Migration Stock

Table 13.1 shows that there were more female migrants than male migrants, with more migrants in urban areas than rural areas. At the district level, Magharibi B (121,397), Magharibi A (90,366) and Mjini (73,793) districts had the most migrants compared to the other districts. Consequently, Mjini Magharibi region had more than half (285,556) of the total migrants and that reflects those districts with substantial migration stock.

Generally, the results revealed that more women migrate internally between the regions of Zanzibar and the Mainland whereas more men immigrate to Zanzibar than women. Furthermore, within Zanzibar and the Mainland Tanzania, more people in the urban areas internally migrated more than those in the rural areas. In terms of immigration, there is not a marked difference between the rural and urban areas (Table 13.1).

Table 13.1: Migration Stock by Sex and Residence, 2019/20 HBS

Characteristics	Internal Migration Zanzibar	Intra-migration Tanzania Mainland	Immigration ¹⁰ (Outside Tanzania)	Total

13.4 Internal migration

Table 13.2 shows that the total internal migrants in Zanzibar is 340,743 and that internal migration is more common among females (203,066) than males (137,677). In terms of age, internal migration initially increased with age and then decreased as age advanced beyond 44 years, with internal migration peaking at the age group of 20-29. The same pattern is observed among males, but, among females, the internal migration peaked at age group 25-29 years.

¹⁰ Note: 0 value does not necessarily mean no immigrants; the sample was not specifically designed to capture immigrants' households.

Table 13.2: Percentage of Internal Migration by Age and sex, 2019/20 HBS

Age group	Both Sexes		Male		Female	
	Number	percent	Number	percent	Number	percent

Zanzibar	340,743	100.0	137,677	100.0	203,066	100.0

Figure 13.3 shows an expansive population pyramid with a broad base but gradually decreases as age increases, which demonstrates the youthfulness of the Zanzibar population. This is contrary to the somewhat constrictive internal migration pyramid which shrunk at the young age but more broadened at the adulthood age group of 15-49 years. This implies that the proportion of migrants at the working age group is relatively high compared to the migrants of the dependent age group. It is notable that among the males at age group 50-54 years, their internal migration decreased but increased for the age group 55-59 years. This often reflects a retirement period and a possible search for new job or returning migrants to their place of origin or place of birth.

Figure 13.2: Internal Migrations and Population Composition by Age and Sex, 2019/20 HBS

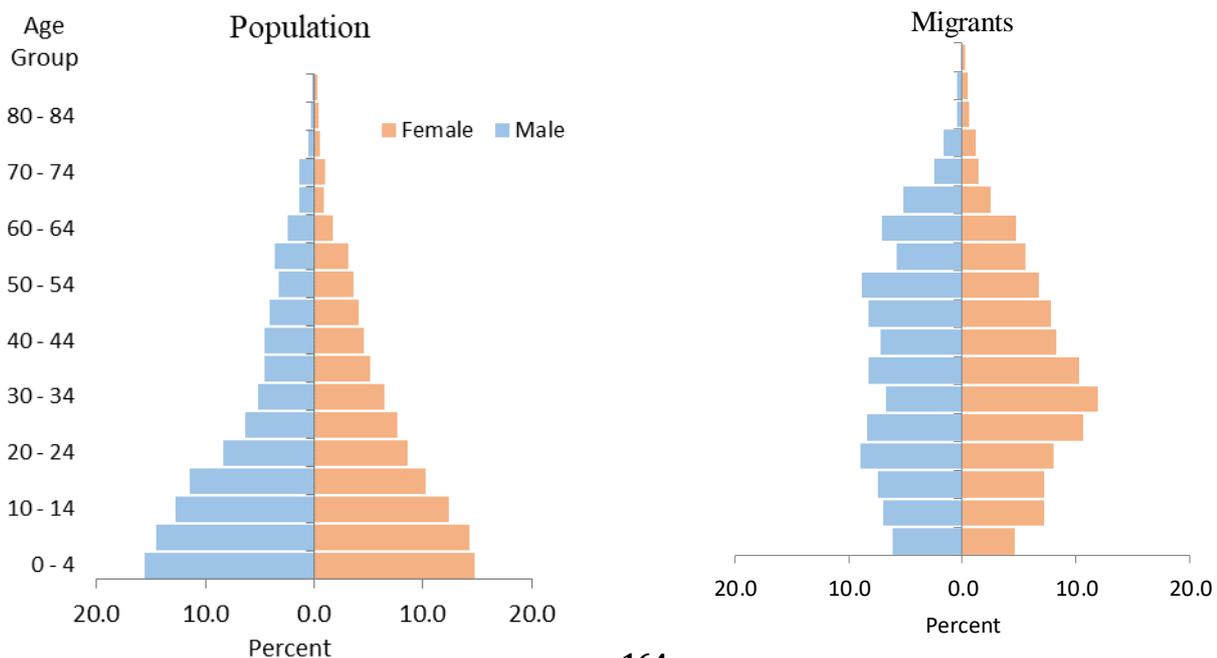

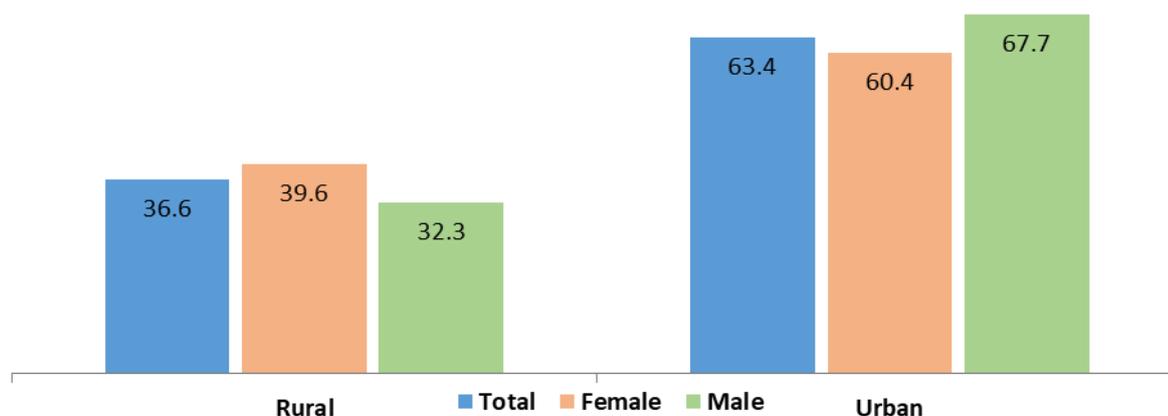

Figure 13.3 illustrates that nearly two-third of internal migrants moved to urban areas (63 percent) compared to more than one-third (37 percent) of migrants who moved to the rural areas. Males migrants were slightly more in urban areas (68 percent) compared to female migrants (60 percent).

Figure 13.3: Internal Migrations by Area and Sex, 2019/20 HBS

Furthermore, there is a notable difference in the number of internal migrants across the districts, ranging from the lowest 7,565 migrants in Kaskazini A district to the highest 101,372 migrants in Magharibi B district. Each district has a considerably more female migrants compared to the males (Table 13.3).

Table 13.3: Percentage of Internal Migration by Sex and District, 2019/20 HBS

District	Male	Females	Number
Kaskazini A	23.2	76.8	7,565

Zanzibar	40.4	59.6	340,743

13.5 Reason for Internal migration

People internally migrate for several reasons. From the 2019/20 HBS, the most commonly mentioned reasons by internal migrants are housing (36 percent), followed by marriage (27 percent) and other family reasons (25 percent). Other reasons include the search for jobs (5 percent) and for schooling or studies (4 percent). The breakdown of these reasons by area of residence can be found in Table 13.4.

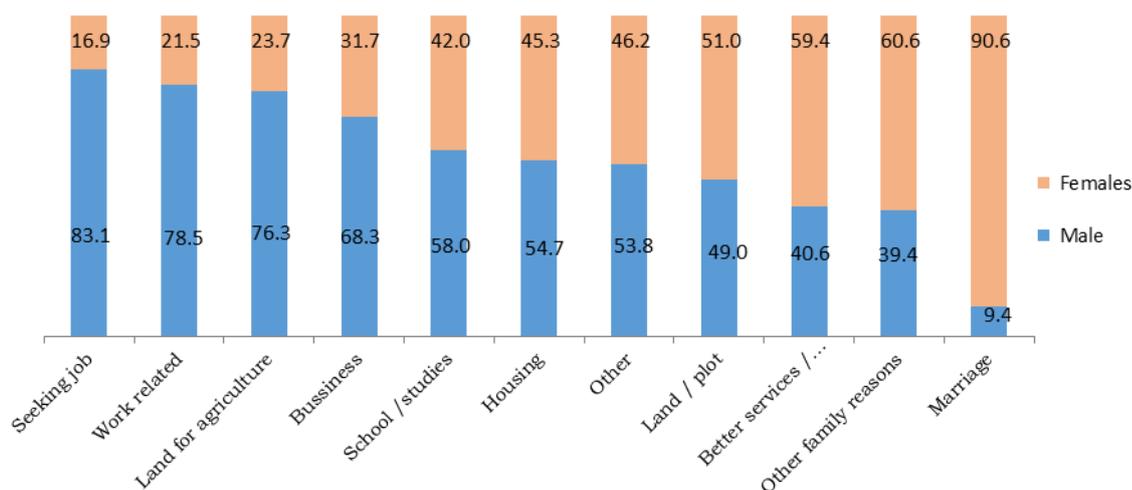

Table 13. 4 Percentage of Reasons for Internal Migration by Areas, 2019/20 HBS

Reason	Rural	Urban	Total
Housing	29.1	39.6	35.7
Marriage	32.9	23.9	27.2
Other family reasons	28.5	22.4	24.7
Seeking job	2.0	6.5	4.8
School /studies	2.5	4.5	3.8
Work related	1.1	1.1	1.1
Other	1.5	0.7	1.0
Better services / housing	1.1	0.6	0.7
Bussiness	0.4	0.5	0.5
Land for agriculture	0.8	0.1	0.3
Land / plot	0.1	0.2	0.16
Total	124,874	215,869	340,743

13.5.1 Reason for Internal migration and sex

The sex of a person could influence their potential reasons for internal migration. Figure 13.4 clearly shows marked differences in the proportion of internal migrants for the same reasons for males and females. The majority (83 percent) of male migrants were seeking job, 79 percent for work related purposes and 76 percent related to land for agricultural purposes. This is contrary to female migrants with an overwhelming majority (91 percent) of them migrating for the reasons of marriage, 61 percent for other family reasons and 59 percent for better service or better housing.

Figure 13. 4 Percentage of Reasons for Internal Migration by sex, 2019/20 HBS

13.5.2 Reasons for internal migration and age

The age of a person may influence their reasons for internally migrating. From Table 13.5, a majority (58 percent) of children aged 0-14 were internal migrants for other reasons, 49 percent for various other family reasons and 31 percent for schooling or studies. The youth aged 15-34 reported business, better service and schools or studies as their reasons for internal migration with proportion of 56 percent, 55 percent and 53 percent respectively. Adults aged 35-64 years reported land/plot (68 percent), land for agriculture (66%) and seeking job (63%) as their reasons for migration. For those aged 65 years and above, owning a land or plot (32 percent) and work-related (12.7 percent) were the main reasons for their internal migration (Table 13.5).

Table 13.5: Reasons for Internal Migration by Age, 2019/20 HBS

Reasons	Age				Number
	0-14	15-34	35-64	65+	
Seeking job	0.0	27.5	63.1	9.4	16,493
Work related	0.0	29.6	57.7	12.7	3,881
Land for agriculture	0.0	26.2	65.8	8.0	1,115
Business	0.0	56.1	36.0	7.9	1,641
School /studies	31.4	52.9	13.2	2.5	12,943
Marriage	0.0	45.4	50.2	4.4	92,646
Other family reasons	48.7	34.1	14.0	3.2	84,012
Better services / housing	27.0	54.5	14.2	4.3	2,540
Housing	16.1	33.7	45.7	4.5	121,674
Land / plot	0.0	0.0	68.0	32.0	546
Other	58.1	22.2	11.0	8.7	3,254
Total	19.7	37.4	38.4	4.5	340,743

The nature of district and availability of infrastructure, goods or services could possibly influence internal migration. Six out of ten migrants in Magharibi B (60 percent) district and 48 percent in Magharibi A district cited housing as their reason for internal migration. Other family reasons are mainly provided by migrants residing in Micheweni district (46 percent) Chake Chake district (45 percent) and Wete districts (39 percent). Marital reasons were mostly reported in Mkoani district (46 percent) and Kaskazini B district (42 percent). Seeking job reason is mainly provided by migrant residing in Mjini district (12 percent), Kusini district (7 percent) and Kaskazini B district (5 percent) (Table 13.6).

Zanzibar Household Budget Survey 2019/2020

13.6 Internal migration and duration of stay

The duration of stay after migration is an important aspect for any settlement policies. Figure 13.5 shows that 48 percent of internal migrants stayed for more than 10 years in their current residence; followed by about 20 percent staying between 5-9 years, 23.8 percent between 1-4 years and about 8 percent staying for periods less than a year.

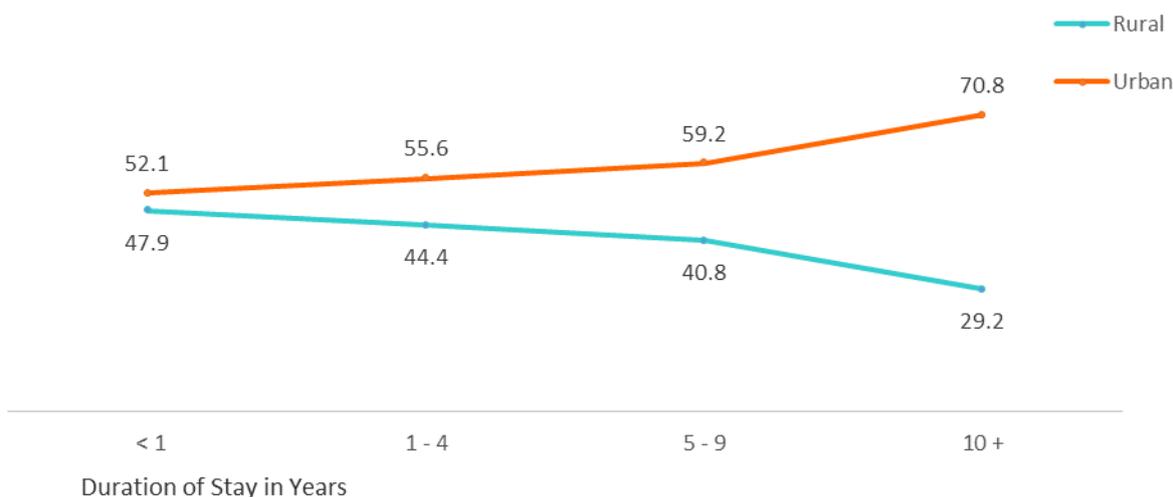

Figure 13. 5 Internal Migration and Duration of Stay, 2019/20 HBS

13.6.1 Internal migration, duration of stay and Area

The area a person migrates to may influence the migrant’s duration of stay. Figure 13.6 shows that internal migration in urban areas is generally higher than in rural areas at any given duration of stay. Furthermore, it appears that in rural areas, internal migration is considerably more current than in urban areas as their proportion shows a reverse pattern. The proportion of internal migrants in the rural areas decreased as the duration of stay (in years) increased, contrary to the observation for the urban areas. A possible explanation for these results is that as migrants stay in rural areas for some time, they change their area of residence to the urban areas or the urban areas generally tend to retain migrants more than the rural areas.

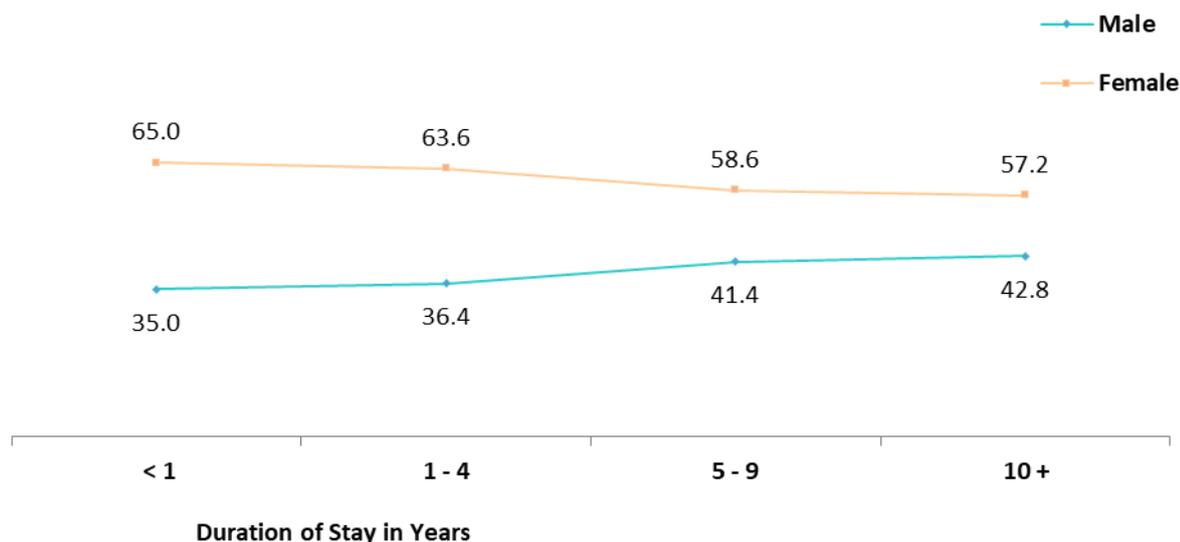

Figure 13. 6: Internal Migration and Duration of Stay by Area, 2019/20 HBS

13.6.2 Internal migration, duration of stay and sex

Figure 13.7 shows that the percentage of females who are internal migrants decreased with duration of stay, with the proportion higher (65 percent) when duration of stay is less than one year but lower by 8 percentage point (57 percent) when duration of stay is above ten years. For males, however, the pattern is different as the proportion slightly increases with the duration of stay, ranging from 35 percent for less than a year to 43 percent for migrants who stayed in a current residence for more than ten years.

Figure 13.7: Internal Migration and Duration of Stay by Sex, 2019/20 HBS

13.6.3 Internal migration, duration of stay and age

The age of a migrant may influence the migrant's duration of stay. Table 13.7 shows that more than a half of the internal migrants (53.8 percent) who were children aged 0-9 years stayed between 1-4 years; four out of ten migrants aged 10-14 years stayed between 5-9 years; with no clear pattern for internal migrants aged 15-34 years in duration of stay. The results further suggest that the most of the adolescent migrants (32 percent) aged 15-19 years stayed for more than 10 years; more than one-third (39 percent) of youth aged 20-24 stayed between one and four years; and 34 percent of youth aged 25-29 stayed between five and nine years. With respect to adult migrants aged 35 years and above, the results revealed that more than one-third of them resided at the same place for more than ten years. This result may suggest that adult migrants tend to be more stable in their new locations, with Table 13.5 revealing the new settlement could be their original place of birth or offering employment opportunities.

Table 13.7: Percentage of Internal Migration and Duration of Stay by Age, 2019/20 HBS

Age Group	Duration of stay in years				Number
	<1	1 - 4	5 - 9	10 +

80 - 84	8.5	3.5	0.0	88.05	1,627
85+	0.0	24.5	0.0	75.50	719
Total	7.7	23.8	20.6	47.9	340,743

13.6.4 Internal migration, duration of stay and District

Table 13.8 shows that 2 out of the 11 districts – Chake Chake (24 percent) and Micheweni (17 percent) had higher proportion of internal migrants with a duration of stay of less than a year in relation to the remaining districts. More than one-third of migrants in Kaskazini A (38 percent) and in Kaskazini B (39 percent) districts stayed between 1-4 years; more than a half of the migrants in Mjini (60%) and Magharibi A (51%) districts stayed for more than ten years.

Table 13.8: Percentage of Internal Migration and Duration of Stay by District, 2019/20 HBS

District	Duration in years				Number
	<1	1 - 4	5 - 9	10 +	
Kaskazini A	4.6	37.5	21.5	36.4	7,565
Kaskazini B	7.1	38.6	22.8	31.5	14,312

Chake Chake	24.3	26.6	12.8	36.3	18,074
Mkoani	14.4	24.9	17.6	43.1	9,996
Total	7.7	23.8	20.6	47.9	340,743

13.7 In-Migration and Out-Migration by district of Birth

Migration by place of birth can be derived from the population by district of enumeration at the time of survey, cross-tabulated with the respondent's district of birth. Table 13.9 shows that out of the total 1.6 million Zanzibar population, 304,544 were living outside their districts of birth at the time of the 2019/20 HBS with different patterns of population redistribution across district. Net-migration is positive in Magharibi A and Magharibi B districts. All other remaining districts have negative net-migration, with Kaskazini A and Mkoani districts losing most people to the other districts (Table 9).

Table 13.9: Number of In-Migration, Out-Migration and Net-Migration by District of Birth, 2019/20 HBS.

District	In-Migrants	Out-Migrants	Net-Migrants	Gross-Migration
Zanzibar	304,544	304,544	0	
Kaskazini A	5,403	37,228	-31,825	42,631
Kaskazini B	12,642	18,454	-5,812	31,096
Kati	15,496	21,323	-5,827	36,819
Kusini	7,365	23,551	-16,187	30,916
Mjini	51,273	70,732	-19,459	122,005
Magharibi A	74,382	20,237	54,145	94,619
Magharibi B	94,192	16,299	77,893	110,492
Wete	13,088	21,660	-8,572	34,748
Micheweni	8,456	19,468	-11,011	27,924
Chake Chake	14,663	24,767	-10,104	39,431
Mkoani	7,583	30,825	-23,242	38,408

13.8 Current Migration by Place of District of Residence

The current migration covers only migration between Zanzibar districts by considering a change in district of previous residence. Data on inter-district flows of current migration can be derived from the population by district of enumeration at the time of survey, cross-tabulated with the district of residence (in this case, two years before the survey). In addition, the analysis excludes migrants with a duration of stay below one year. Table 13.10 shows that the total number of current migration two years preceding the survey is 39,925, with Magharibi B showing positive net migration, that is to say their current intra-district migration displays similar pattern to a lifetime migration. On the other hand, contrary to life time migration, the results indicate that Kaskazini B, Kati, Micheweni and Chake Chake districts experiences a negative net migration by place of birth (Table 13.9), but currently experienced a positive net migration (Table 13.10). That means, two years preceding the survey, these districts are currently gaining and attracting more migrants.

Table 13.10: Current Inter-District Migration (Number) Zanzibar, 2019/20 HBS.

District	In-Migration	Out-Migration	Net-Migration	Gross-Migration
Zanzibar	39,925	39,925	0	
Kaskazini A	1,228	3,839	-2,612	5,067
Kaskazini B	2,332	1,140	1,192	3,472
Kati	3,097	2,899	198	5,997
Kusini	1,201	1,510	-309	2,710
Mjini	6,695	8,835	-2,140	15,530
Magharibi A	7,031	7,208	-178	14,239
Magharibi B	11,221	4,632	6,589	15,852
Wete	2,361	2,925	-563	5,286
Micheweni	1,982	1,955	27	3,937
Chake Chake	1,750	2,520	-770	4,271
Mkoani	1,029	2,462	-1,433	3,490

13.9 District proportion of internal migration by Place of birth

The district with the highest proportion of in-migrants by place of birth is Magharibi B (70 percent), followed by Magharibi A (69 percent), with Kaskazini A (5 percent) representing the lowest. The district with the highest proportion of out-migrants by place of birth is Kusini (61 percent), with Magharibi B (12 percent) representing the lowest (Table 13.11).

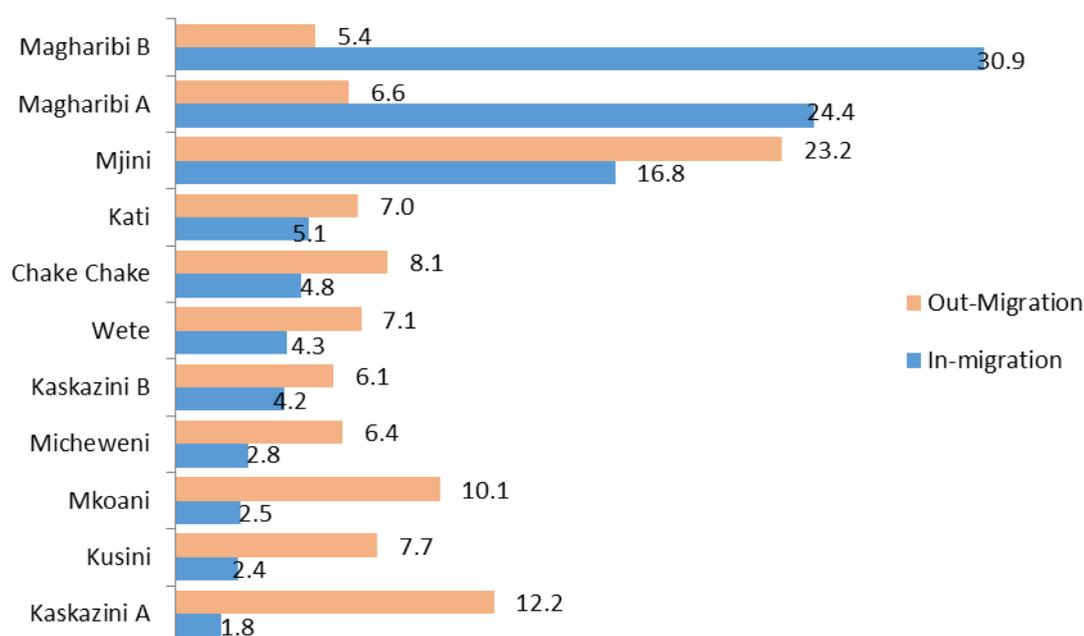

Table 13.11: Percentage Share of In-migrants and Out-migrants by District of Birth, 2019/20 HBS

Location	None Migrant		In-Migrants		Out-Migrants		As a Percentage of Non-Migrants	
	Number	Percentage	Number	Percentage	Number	Percentage	In-Migrants	Out-Migrants

13.9.1 Districts contributions to internal migration by Place of birth

Magharibi B and Magharibi A districts are dominating total Zanzibar in-migration population by having a proportion of 31 percent and 24 percent of in-migrants respectively. Mjini and Kaskazini A districts are dominating out-migration in Zanzibar with 23 percent and 12 percent respectively (Figure 13.8).

Figure 13.8: Percentage Share of In-migration and Out-migration by District of Birth, 2019/20 HBS

13.10 Index of Relative Representation (IRR)

In the 2019/20 HBS, the index of relative representation is used to estimate the share of migration to the total population size of the district. The index controls for the relative population size of the district while examining their share of inter-regional or intra-district in-migration and out-migration.

Table 13.12 shows that Magharibi A and Magharibi B contributed more to in-migration than their contribution to Zanzibar population. The number of districts which contributed more to in-migration were fewer than those which contributed more to out-migration. The districts which contributed more in out-migration are Kusini, Kaskazini A, Mjini, Mkoani and Kati.

Table 13.12: Percentage Distributions Relative Representation Index (IRR) by Districts, 2019/20 HBS

District	Number	Percent	Percent share		IRR	
			In	Out	In	Out
Kaskazini A	127,131	7.8	1.8	12.2	22.7	156.7

**CHAPTER FOURTEEN:
TRANSFER OF GOODS AND SERVICES / REMITTANCES**

14.1 Introduction

This chapter presents findings for the amount of remittances received in 2018, remittances used, and the value of remittances by country, remitter’s demographic characteristics and information on transfer of goods and services.

14.1.1 Remittance Recipient Households

The largest proportion of households that received remittances were found in Magharibi A district (17.3 percent), followed by Mjini and Wete (17.3 percent and 15.7 percent respectively). This partially implies that the above districts have a considerable proportion of its population living outside the country. Furthermore, Chake Chake accounted 13.3 percent and Kaskazini B have the lowest proportion (1.1) as shown in Table 14.1 below.

Table 14.1: Percentage of Remittance Recipient Households by District, 2019/20 HBS

District	Remittance Recipient Households	Percent
Kaskazini A	972	2.0
Kaskazini B	548	1.1
Kati	3,254	6.6
Kusini	1,935	3.9
Magharibi A	9,043	18.4
Magharibi B	3,859	7.9
Mjini	8,513	17.3
Wete	7,725	15.7
Micheweni	3,092	6.3
Chake chake	6,486	13.2
Mkoani	3,708	7.5
Total	49,136	100

The survey also shows that close to eight out of ten males (78.1 percent) have at least one member or friend of their households living abroad. There is no much difference for the households having at least a member living abroad in rural and urban area as indicated in Figure 14.2. Mjini district had the highest percentage of households who have family members or friends living abroad (18.4 percent) while Kaskazini B had the lowest (1.1 percent) (Figure 14.3).

Figure 14. 3 Percentage of households who have family members or friends living abroad by sex

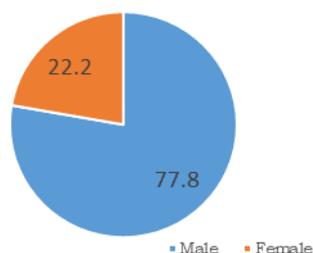

Figure 14. 2 Percentage of households who have family members or friends living abroad by area

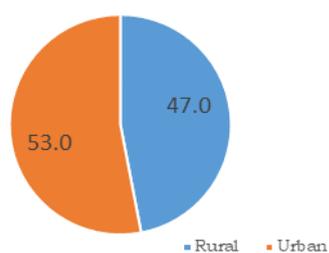

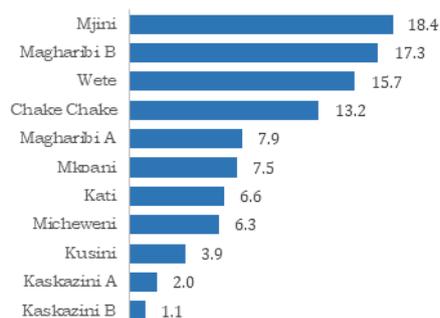

Figure 14. 2 Figure 14.3: Percentage of households who have

As indicated in Table 14.2, 26.3 percent of remitters sent money or items to Magharibi B district (26.3 percent), followed by Mjini (19.5 percent), with the Kaskazini B representing the lowest. The urban areas had more proportion of households that received money or items from abroad than the rural areas.

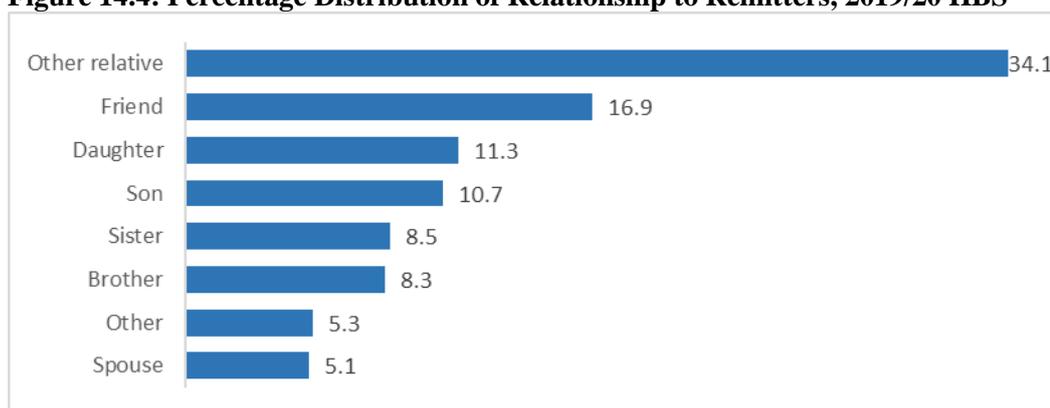

Table 14.2: Percentage of Households that Sends Money or Items from Abroad In 2018, 2019/20 HBS

Characteristics	No Person send	1 Person	2 Person	3+ Person	Total
Male	84.2	66.6	76.9	76.8	74.4
Female	15.8	33.4	23.1	23.2	25.6
Rural	38.3	38.0	16.4	53.7	36.5
Urban	61.7	62.0	83.6	46.3	63.5
Kaskazini A	1.5	1.9	0.0	0.0	1.5

Mkoani	0.0	5.5	0.0	0.0	2.8
Total	6,050	8,397	1,612	563	16,622

14.1.3 Relationship to Remitter

The survey sought to establish the relationship between the head of household and the remitters. More than one-third remitters are other relatives that are blood-related (34.1 percent), followed by friends (16.9 percent), daughters (11.3 percent), sons (10.7 percent), with spouses constituting the lowest proportion of remitters (5.1 percent) (Figure 14.4).

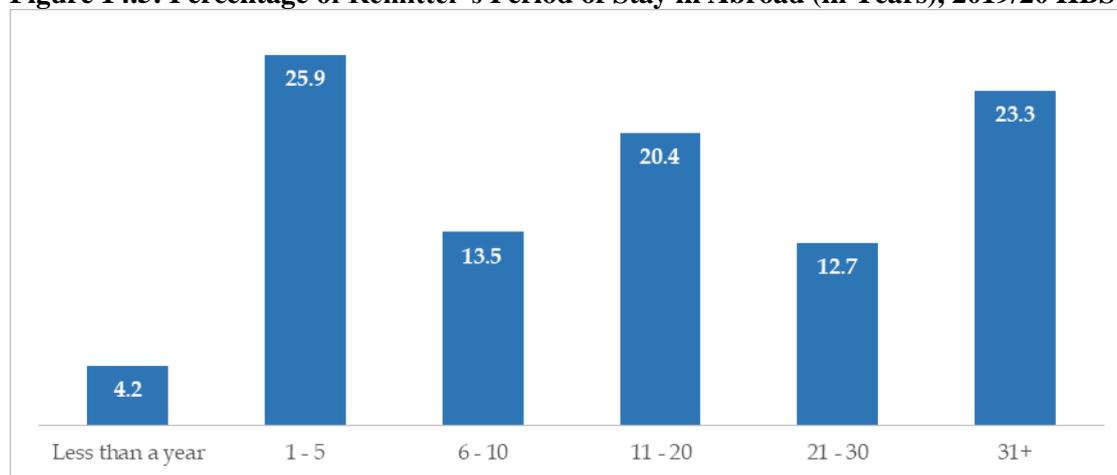

Figure 14.4: Percentage Distribution of Relationship to Remitters, 2019/20 HBS

14.1.4 Period Remitter has Lived Abroad

Analysis for duration of living abroad reveals that about a quarter of remitters (25.9 percent) have lived abroad between 1-5 years, followed by 23.3 percent who have lived over 31 years, with those who have lived abroad for less than a year forming the least proportion (4 percent) (Figure 14.5).

Figure 14.5: Percentage of Remitter’s Period of Stay in Abroad (in Years), 2019/20 HBS

14.1.5 Age and Marital Status of Remitters

Age distribution shows that most of the remitters were between the ages of 40 – 49 years. This shows that the productive population is actively working from outside the country. Among the male remitters, 50-59 age group had the highest proportion of remitters (21.2 percent) while for the female remitters, the age group of 40-49 have the most remitters (27.2 percent). Apart from the age groups of 20-29 and 40-49 years, all the other age groups had more remitters who were males (Table 14.3).

Table 14. 3: Percentage of Remitter’s Age by Sex, 2019/20 HBS

Age group of Remitter	Sex of Sender		
	Male	Female	Both sexes
20 - 29	1.9	14.1	6.7
30 - 39	19.1	18.4	18.8
40 - 49	20.6	27.2	23.2
50 - 59	22.1	19.8	21.2
60 - 69	13.3	10.9	12.3
70+	23.1	9.6	17.7
Total percent	100	100	100

The analysis by marital status of remitters indicated that 81.3 percent of them were married. The other categories constitute divorced (10.8 percent) and single (6.7 percent). There were more married female remitters (83.7 percent) than married male remitters (79.8 percent).

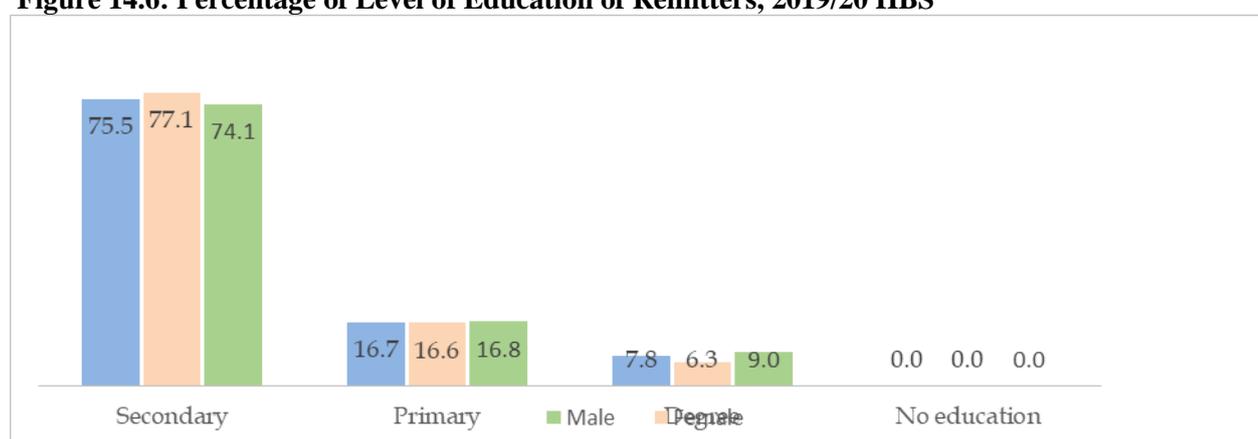

Table 14.4: Percentage of Remitter’s Marital Status by Sex, 2019/20 HBS

Marital status	Male	Female	Both Sexes
Single	8.7	3.7	6.7
Married	79.8	83.7	81.3
Divorced	10.3	11.6	10.8
Separated	0.0	0.0	0.0
Widow	0.0	1.1	0.4
Living together	0.0	0.0	0.0
Not mentioned	0.0	0.0	0.0
Don't Know	1.3	0.0	0.8
Total	100	100	100

14.1.6 Level of Education of Remitters

About three-quarter of remitters (75.5 percent) were reported to have attained secondary education, 7.8 percent attained a degree level education. Additionally, more than three quarters of female remitters (77.1 percent) had secondary level of education compared to the male remitters (74.1 percent). Finally, there was more male remitters with a degree level of education compared to female remitters (Figure 14.6).

Figure 14.6: Percentage of Level of Education of Remitters, 2019/20 HBS

14.1.7 Labour Status of Remitters

More than half of remitters (58.5 percent) were employees; 20.4 percent belonged to the Housewife/Househusband category while the retired constituted 9.3 percent of remitters. The results further reveal that 7.9 percent of remitters were Self Employed without Employees in non-agriculture while 2.3 percent of them were Self Employed with Employees in non-agriculture (Table 14.5).

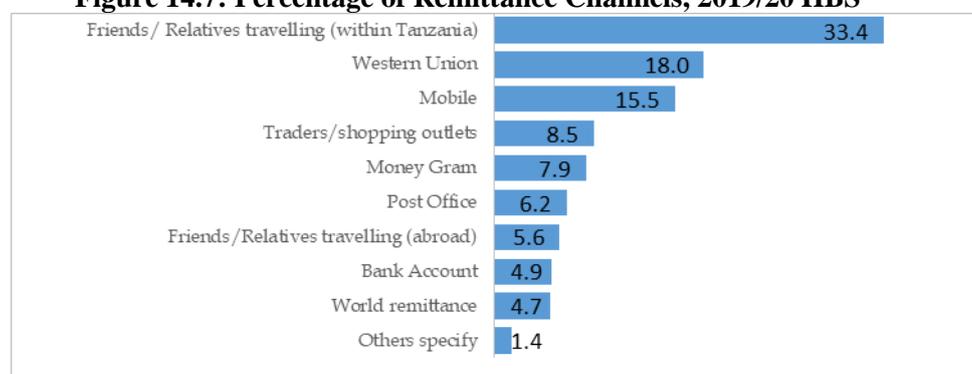

Table 14.5: Percentage of Labour Status of Remitters, 2019/20 HBS

Labour Status of Remitters	Sex		
	Male	Female	Both sexes
Employee	68.7	43	58.5

Total	100	100	100

14.1.8 Remittance Channels

The results in Figure 14.7 reveal that Friends or Relatives travelling within Tanzania is the most frequent channel of remittance in Zanzibar (33.4 percent), followed by Western Union (18 percent) and Mobile (15.5 percent). The analysis further shows that the recipients in Zanzibar also receive remittances through other channels like Bank Account, Post Office, Money Gram, World Remittance and Traders/Shopping outlets (Figure 14.7).

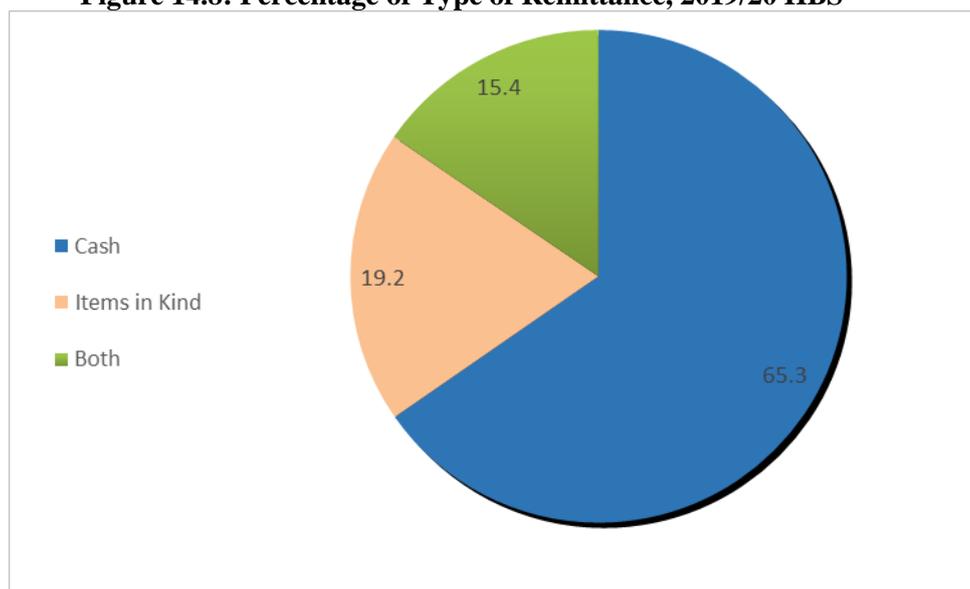

Figure 14.7: Percentage of Remittance Channels, 2019/20 HBS

14.1.9 Remittance by Type

The highest proportion (65.3 percent) of recipient households received only cash remittances while 19.2 percent received items in kind. The remaining 15.4 percent received remittances both in cash and in kind (Figure 14.8).

Figure 14.8: Percentage of Type of Remittance, 2019/20 HBS

14.1.10 Reason for Use of Remittance Channels

In Table 14.6, the reason given for using a particular remittance channel is presented. The result reveals that sender's choice is the most reason (39.9 percent) for using a remittance channel, with easy access (33 percent), my usual way (12 percent) and favourable transaction cost (11.3 percent) given as the other main reasons. Moreover, of all those who gave sender's choice as the reason for using a particular remittance channel, majority of them (55.2 percent) chose the channel of family and friends travelling either abroad or within Tanzania. Security and safety were the main reason behind the choice of Western Union and mobile platform channels.

Table 14.6: Percentage of Reasons for Using the Remittance Channels, 2019/20 HBS

Channel	Reason for Use of Remittance Channels						Total
	Favourable transaction charges	Easy Access	Sender's Choice	Security/safety	My usual way	Other

14.1.11 Remittances by Source of the Country

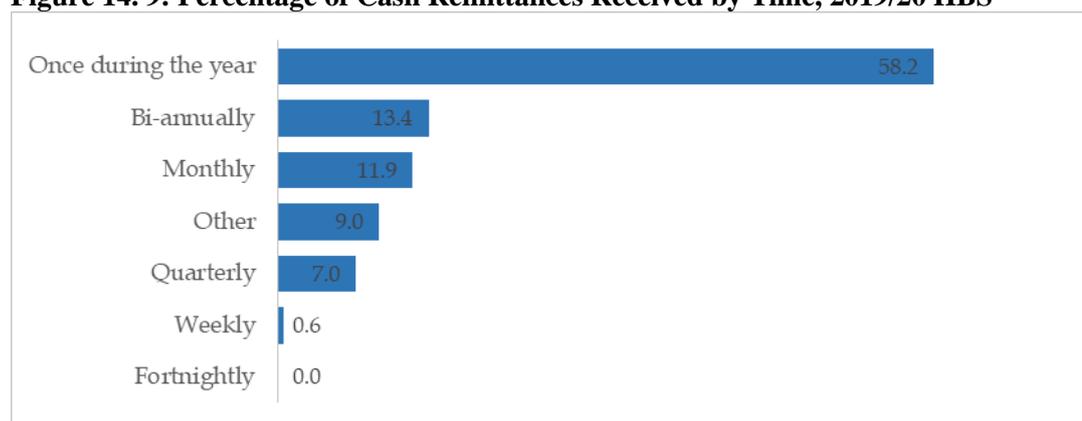

The biggest source of remittances to Zanzibar originated from Oman (42.4 percent), followed by United Kingdom (14.9 percent), Canada (4.7 percent) and Australia (3.3 percent). In Table 14.7, the types of remittances and the countries they originated from can be observed in greater detail.

Table 14.7: Percentage of Remittances by the Source of the Country, 2019/20 HBS

14.1.12 Frequency of Cash Remittance Receipts

Close to 6 out of 10 recipients (58.2 percent) received remittances once during the year; 13.4 percent received bi-annually; with 11.9 percent receiving remittances monthly (Figure 14.9). Those who received remittances quarterly constituted 7 percent with less than one percent of recipients receiving remittances weekly.

Figure 14. 9: Percentage of Cash Remittances Received by Time, 2019/20 HBS

14.1.13 Uses of Remittances

As shown in Table 14.8, more than two-third of remittances received (69.6 percent) were spent on consumption, and 24.4 percent spent on savings and investment. A further disaggregation reveals however that household expenses (e.g. Food, Clothing, Rent) were the major consumption items, accounting for the biggest share (42.3 percent) of total remittances. This was followed by education (e.g. Uniforms, Meals, Books, Pocket money, Fees) (17.4 percent) and building works (Construction, Renovation, Expansion) (12.4 percent).

Table 14.8: Percentage of the Uses of Remittances 2019/20 HBS

Uses	Amount in TZS	Percent
Consumption	7,167,198,688	61.9
Households expenses (e.g. Food, Clothing, Rent)	4,357,034,766	37.6

CHAPTER FIFTEEN: NON-COMMUNICABLE DISEASES

15.1 Introduction

The 2019/20 HBS captured information on Noncommunicable Diseases (NCDs), also known as chronic diseases, that tend to be of long-term duration and are the result of a combination of genetic, physiological, environmental and behaviors factors. The main types of NCDs are cardiovascular diseases (like heart attacks and stroke), cancers, chronic respiratory diseases (such as chronic obstructive pulmonary disease and asthma) and diabetes. Noncommunicable Diseases (NCDs), for the purposes of analysis, are due to multiple causes and are not passed or transmitted directly or indirectly from one person to another or by any agency. During the 2019/20 HBS, questions were asked as to whether any person was told by a doctor or health worker that he/she had an NCD, any involvement in a road traffic accident as a driver, passenger, pedestrian, or cyclist in the past 12 months or any injury not related to road traffic accident.

15.2 Hypertension and Diabetes

According to the World Health Organization (WHO), the prevalence of hypertension is highest in the African Region, with 46% of Africans aged 25 years and above suffering from an NCD, while the lowest was found in the American region. Hypertension is defined as systolic BP (SBP) ≥ 140 mmHg and/or diastolic BP (DBP) ≥ 90 mmHg, that is, $\geq 140/90$ mmHg¹¹. Hypertension, also known as high or raised blood pressure (BP), is a global public health challenge. Hypertension is a chronic medical condition in which the BP in the arteries is elevated. The higher the pressure in the blood vessels the harder the heart has to work in order to pump blood, thus making the heart to work too hard. It is popularly known as the “silent killer,” because it has no specific signs and symptoms in the initial stages.

Table 15.1 and Figure 15.1 show the percentage distribution of population aged 25 and above who reported to be suffering from Hypertension from the 2019/20 HBS. The results indicate that 12.7 percent out of total population aged 25 and above (627,402) was suffering from the hypertension (high blood pressure), and as little as 1.3 percent was suffering from diabetes. The gender distribution revealed that more females were suffering from hypertension and diabetes compared to males. Furthermore, the prevalence of both hypertension and diabetes was higher in urban areas than in rural areas.

The prevalence of hypertension is higher among the older age groups compared to the younger ones. For instance, about half of the population aged 75-79 (44.9 percent) and more than one-third of the population aged 70-74 were suffering from hypertension, compared to the low prevalence in the younger age groups (Table 15.1).

At the district level, Figure 15.1 indicates that Chake Chake, Mjini, Kusini and Magharibi A districts had most people suffering from hypertension compared to the other districts. The prevalence of diabetes is highest in Mjini district, with 2.5 percent of its population suffering from it, followed by Kusini district (1.8 percent), and the lowest being Kaskazini A (0.7 percent) and Mkoani (0.6 percent).

15.3 Cancer

Cancer is the uncontrolled growth of abnormal cells anywhere in a body¹². Anything that may cause a normal body cell to develop abnormally can potentially cause cancer. The general categories of cancer-related agents are as follows: chemical or toxic compound exposures, ionizing radiation, some pathogens, and human genetics. Cancer staging is often determined by biopsy results and helps determine the cancer type and the extent of cancer spread. Staging also helps caregivers determine treatment protocols. In general, in most staging methods, the higher the number assigned (usually between 0 to 4), the more aggressive the cancer type or more widespread is the cancer in the body. Staging methods differ from cancer to cancer and need to be individually discussed with your health care provider. During the 2019/20 HBS, questions were asked to understand whether women heard of cervical cancer, and whether they have undergone a test/examination for cervical and breast cancer.

15.3.1 Awareness of Cervical Cancer

The results presented in Table 15.2 reveal that the awareness of cervical cancer was higher in the urban areas than the rural areas. Awareness of cervical cancer is highest among women aged 25-29 years (17.1 percent), followed by 20-24 years (16.5 percent), and 30-34 years (15.3 percent), etc. Furthermore, Mijini (24.9 percent), Magharibi B (21.5 percent) and Magharibi A (17.8 percent) were the districts with the highest proportion of women having awareness of cervical cancer in relation to the other districts.

15.3.2 Testing for Cervical Cancer

Table 15.2 shows the proportion of women who got tested for cervical cancer. It is not surprising that a higher proportion of women in the urban areas got tested for cervical cancer (11 percent) than their counterparts in the rural areas (5.9 percent). Largely, the results revealed that getting tested for cervical cancer increased as the age of the women increased. At the district level, Mkoani had the highest proportion of women getting tested for cervical cancer (19.1 percent), followed by Mjini, Kusini, Magharibi A and Magharibi B districts with about 11 percent each.

15.3.3 Breast Cancer

15.3.3.1 Breast Self-examination

Breast cancer screening means checking a woman's breasts for cancer before the signs or symptoms of the disease¹³ develop. Table 15.3 indicates that out of 306,987 women aged 20-49 years, only 8.5 percent of them had a self-check for breast cancer. Of all the women who conducted self-check for breast cancer, a higher proportion resided in the urban areas (9.7 percent) than in rural areas (7.3 percent). A self-check for breast cancer among women is highest for those aged 45-49 years (11.4 percent) and, unsurprisingly, lowest in the population aged 20-24 years (7.3 percent). The results fairly reveal that as women aged, they took the initiative to self-check their breasts for any possible signs and/or symptoms of breast cancer. Compared to the other districts, Kusini (17.4 percent), Kaskazini A (16.4 percent), Magharibi B (11.2 percent), Magharibi A (9.7 percent) and Mjini (9.7 percent) were the districts with the highest proportion of women conducting a self-check for breast cancer.

¹³ https://www.cdc.gov/cancer/breast/basic_info/screening.htm

15.3.3.2 Examination by Health Professional to Detect Breast Cancer

A breast exam by a health professional (such as doctors, nurses, nurse practitioner, or physician assistant) is an important part of routine physical checkups¹⁴. Table 15.3 shows that out of 25,973 women respondents, just one out of every three of them (31.4 percent) underwent breast examination to detect breast cancer. Additionally, more women in the urban areas underwent examination compared to those in the rural areas. The results further reveal that examination for breast cancer increased largely with the aged of the women. Table 15.3 also contains the proportion of women in the various districts of Zanzibar that underwent examination to detect breast cancer, with about 65 percent of women in Micheweni undergoing breast examination for breast cancer.

Table 15.3: Proportions of Women Who Self-check their Breasts, and Underwent Examination to Detect Breast Cancer, 2019/20 HBS

15.4 Injury

During the data collection for the 2019/20 HBS, all household members were asked to report on injuries incurred that were related to road traffic accident, and those injuries not related to road traffic accidents during the last two weeks preceding the survey.

¹⁴ <https://www.webmd.com/breast-cancer/doctors-breast-exam>

15.4.1 Road Traffic Accident

Road traffic injuries cause considerable economic losses to individuals, their families, and to the nation as a whole. These losses arise from the cost of treatment, as well as, lost productivity for those killed or disabled by their injuries, and for family members who need to take time off work or school to care for the injured¹⁵. Table 15.4 shows that the percentage of respondents who reported an injury caused by road traffic accident was 1.9 percent, with a marginally higher proportion of these in the urban areas compared to the rural areas. People

aged between 60–64 most reported injury caused by road traffic (5.0 percent), followed by 50-54 (3.9 percent), while children under 10 years least reported road traffic accident (0.8 percent). More males reported to be injured from accidents related to road traffic (3.2 percent) than women (0.8 percent). The 2019/20 HBS result further reveals that Kati district recorded the highest proportion of individuals injured by road accident (3.2 percent), followed by Chake Chake district (2.9 percent), with Kaskazini A district representing the lowest in this regard.

15.4.2 Accident not Related to Road Traffic Accident

An accident is an unplanned event that sometimes has inconvenient or undesirable consequences, other times being inconsequential. The occurrence of such an event may or may not have unrecognized or unaddressed risks contributing to its cause. Most scientists who study unintentional injury avoid using the term "accident" and focus on factors that increase the risk of severe injury and that reduce injury incidence and severity¹⁶. Table 15.4 shows the percentage of respondents who reported accident not related to road traffic accident. The results reveal that 5.2 percent of the respondents said they had an injury not related to road traffic accident, with more rural residents affected than urban residents. With respect to age, an injury not related to road traffic accident was highest among the age group of 70-74 years (12.6 percent), followed by 75-79 years (9.4 percent), with the result largely revealing that this type of injury increases with age. At the district level, Chake Chake had the highest rate of injury not related to road traffic accident (17.5 percent), followed by Kusini (9.3 percent), with Kaskazini A experiencing the lowest (2.6 percent).

15.4.3 Causes of Injury

An injury is a damage to your body. It is a general term that refers to a harm caused by accidents, falls, hits, weapons and more¹⁷. These injuries range from minor to life-threatening. In Zanzibar, injuries happen from animal bites, near drowning, injuries, burn, cut and fall. From Table 15.5, it can be observed that the most common causes of injury in Zanzibar include a fall (44.2 percent), a cut (37.7 percent), a burn (9.4 percent), animal bite (5.4 percent), with the lowest being near drowning (0.9 percent).

Furthermore, a 47.9 percent of injuries from a fall was recorded in the urban areas while 41.2 percent was recorded in the rural areas. More females had injuries from a fall compared to males, while more males had injuries from a cut than females. The district level and age group breakdowns of the injury causes can also be observed from Table 15.5.

Table 15.5: Percentage of Individuals Who Reported Injury by Cause in the Past Two Weeks, 2019/20 HBS

	Cause of Injury						Total

15.5 Risk Factors

15.5.1 Alcohol Consumption

During the 2019/20 HBS, the prevalence of alcohol consumption and the frequency of alcohol consumption among the population were assessed. Table 15.6 revealed that only 0.8 percent out of 765,425 respondents were current consumers of alcohol, while the remaining 99.2 percent never took any alcohol for those aged 20 years and above. The residents in the urban areas consumed more alcohol than their counterparts in the rural areas; men consumed more alcohol than women (Table 15.6).

The results further reveal that the prevalence of drinking alcohol largely decreased with age as the population belonging to the younger age groups consumed more alcohol, and no respondents from age 60 years and above reported drinking any alcohol. At the district level, Kati (3.2 percent), Magharibi B (1.6 percent) and Kusini (1.5 percent) are the districts with the highest proportion of the respondents who consumed alcohol.

Table 15.6: Percentage of Population Aged 20 and above Who Drink Alcohol by Area, Sex, Age Group and District, 2019/20 HBS

	Drink Alcohol		Total	Mean number of days in which they had an alcoholic drink in the past 2 weeks

15.5.2. Smoking

Smoking, especially tobacco smoking, is the practice of burning tobacco and ingesting the smoke that is produced. The smoke may be inhaled, as is done with cigarettes, or simply released from the mouth, as is generally done with pipes and cigars¹⁸. Table 15.7 presents the proportion of individuals who smoked cigarettes and currently smoked any types of tobacco in the past two weeks prior to the survey. Generally, as little as 1.8 percent of the respondents smoked cigarettes, with less than one percent that currently smoked any types of tobacco in the past two weeks prior to the survey. An equal proportion of respondent in both rural and urban areas smoked cigarettes (1.8 percent each), more men smoked cigarette (3.6 percent) than women (0.1 percent). Furthermore, the prevalence of smoking appears to be largely positively related to age with the respondents with advanced ages smoking more than those of younger ages (Table 15.7).

Table 15.7: Percentage of Population Aged 5 and Above who Smoke Cigarettes and Currently Smoke any Type of Tobacco, 2019/20 HBS

15.5.3. The Use of Other Types of Tobacco

During the 2019/20 HBS, the respondents were asked to mention the other types of tobacco they currently smoked or use. From Table 15.8, it can be observed that chewing tobacco was the main type of tobacco used (24.9 percent), followed by snuff tobacco (20 percent), with several other types grouped within the Other category, including water pipes and shishas. The use of snuff and chewing tobaccos were more common in the rural areas compared to the urban areas. It is interesting to note that more females used chewing tobacco (41.5 percent) than males (13.5 percent). Furthermore, the use of snuff and chewing tobaccos increased largely with the age of the respondents. The breakdown of the use of types of tobaccos by districts can also be observed from Table 15.8.

15.6 Physical Exercise

Physical exercise is an activity that enhances or maintains the physical fitness and an overall health and wellness. Regular physical activity can improve muscle strength and boost endurance¹⁹. A lack of physical

¹⁹ En.m.wikipedia.org

Zanzibar Household Budget Survey 2019/2020

activity can lead to an increased risk of NCDs. During the 2019/20 HBS, all household members were asked if they participated in any physical activity for at least 10 consecutive minutes within 24 hours prior to the survey.

The results in Table 15.9 show that only 14.7 percent of household members aged 5 and above engaged in any physical activity for at least 10 consecutive minutes, with most of these physical activities taking place in other places (70.5 percent) other than at home (25.2 percent) or at work (4.2 percent). The results further revealed that engaging in physical exercise is highest for those household members belonging to the age groups ranging from 15 to 64 years, in relation to the other age groups.

At the district level, engaging in physical activities was highest in Magharibi A (21.2 percent), followed by Magharibi B (20.2 percent), and lowest in Micheweni (4.5 percent) as shown in Table 15.9.

15.7 Health Insurance

Health insurance is a type of insurance cover that typically pays for medical, surgical, prescription drugs and sometimes dental expenses incurred by the insured. Health insurance can reimburse the insured for expenses for illness or injury, or pay the care provider directly²⁰. The results presented cover health insurance and type of health insurance (Table 15.10 and Table 15.11). The results generally show that only 3.7 percent of the population (1,625,589) were covered by health insurance, with more urban residents covered (6.7 percent) than rural residents (1.7 percent). Furthermore, there was no marked difference between males and females when it comes to health insurance. At the district level, health insurance is highest among the population in Magharibi A (7.9 percent), closely followed by Magharibi B (7.2 percent), with Mkoani (0.3 percent) representing the lowest (Table 15.10).

Table 15.11 shows the types of health insurance the population is covered with. The results reveal that close to two-third of the population is covered with the NHIF insurance (65 percent), with health insurance through an employer (17 percent) representing the second most common source of health insurance in Zanzibar. Other health insurance schemes include those privately bought or those secured through community-based health insurance schemes.

At the district level, Magharibi A district had most of the NHIF insured population (80.0 percent), followed by Magharibi B (71.0 percent), with Mkoani district representing the lowest with 7 percent (Table 15.11)

ANNEX A1: SAMPLING AND WEIGHTING

The sampling frame for the 2019/20 HBS was based on the data and cartography from the 2012 Tanzania Population and Housing Census (PHC 2012). The population and number of household information in this report are slightly different from those appearing in the NBS/OCGS Census Database. This is because the survey only focused on private/residential households excluding population living in the institutional households such as military barracks, hostels, hospitals and the like. The total Zanzibar population living in private households based on the sampling frame was 1,281,551 instead 1,303,569 for the entire 2012 Zanzibar population, which includes the aforementioned institutional households. This is only a small difference and the numbers in the sampling and weighting spreadsheet relate to the figures in the sample frame. The final weights reflect the updated listing that was conducted in each sample enumeration area (EA). Table A.1 shows percentage distribution of the population in the frame across all 11 districts.

Table A. 1: Population in Sample Frame (based on PHC 2012) by District

District	Population	Percent
Kaskazini A	104,876	8.2
Kaskazini B	77,301	6.0
Kati	73,142	5.7
Kusini	38,537	3.0
Magharibi A	163,812	12.8
Magharibi B	202,704	15.8
Mjini	219,312	17.1
Wete	107,946	8.4
Micheweni	90,723	7.1
Chake Chake	102,255	8.0
Mkoani	100,943	7.9
Zanzibar	1,281,551	100

Table A.2 shows the distribution of the total number of EAs and households in the sample frame for Zanzibar by district. Zanzibar is divided administratively into eleven districts, as identified in Table A.1. Each district is further divided into wards. From the 2012 TPHC, the wards were classified by type of residence as urban, rural or mixed, and all the EAs within a ward were assigned the same classification. For the 2019/20 HBS, the EAs in mixed wards (code 3) were given rural or urban codes. EAs with codes of 300 or above were assigned to the urban category (as they are part of small towns) and the remaining assigned to the rural category.

Table A. 2: Distribution of EAs and Households in Sample Frame by District

District	Number of EAs	Number of households
Kaskazini A	306	20,454
Kaskazini B	139	16,059
Kati	209	16,578
Kusini	132	9,008

Zanzibar	2,956	249,378

Table A.3 presents the average number of households per EA and the average number of people per household (household size) in the sample frame by district and area. The average number of households was slightly

Zanzibar Household Budget Survey 2019/2020

higher for the urban EAs (89.4) than for the rural EAs (80.6). The average household size was 5.1 at the national level and with only a slight difference between rural and urban areas.

Table A. 3: Average Number of Households per EA and Average Household Size in Sample Frame by District and Area

Total	80.6	5.0	89.4	5.3	84.3	5.1

In order to investigate the variability of the EAs by size, Table A.4 shows the distribution of the EAs for different ranges of the number of households by district and area. This table also shows the standard deviation of the number of households by EA, which is a measure of the variability in size. The standard deviation is relatively small and is similar for both rural and urban EAs. Most of the EAs were within the range of 60 to 79 households. The minimum and maximum number of households in an EA were 17 and 252 respectively for the rural stratum, and 12 and 275 respectively for the urban stratum. There were only 26 EAs with less than 30 households in the entire frame. Given the selection of the sample EAs systematically with a probability proportional to size (PPS) within each stratum, such small EAs had a very small probability of selection.

Table A. 4: Distribution of EAs in Sample Frame by Area, 2019/20

Number of households	Rural	Urban	Total
1-29 households	25	7	32
30-59 households	404	180	584
60-79 households	490	341	831
80-99 households	397	332	729
100-119 households	230	210	440
120-149 households	112	126	238
150-199 households	35	51	86
200 + households	8	8	16
Total	1702	1254	2956
<i>Mean</i>	80.6	89.4	84.3
<i>Minimum</i>	17	12	12
<i>Maximum</i>	252	275	275
<i>Std. Dev.</i>	30.1	31.3	30.9

Following the selection of the sample EAs at the first sampling stage, a new listing of households was conducted in each sample EA. As shown in Table A.4, the average size of each EA was 84 households which meant that a thorough, good quality listing could easily take place over one to two days.

At the second sampling stage households were selected from the listing for each sample EA. The units of analysis for the 2019/20 Zanzibar HBS were private households and the persons in these households. The sample frame excluded group quarters such as prisons, military barracks and hospitals.

Stratification of the Sampling Frame for the 2019/20 HBS

In order to increase the efficiency of the sample design for 2019/20 Zanzibar HBS, it was important to divide the sampling frame of EAs into strata that were as homogeneous as possible. The first stage sample selection was carried out independently within each explicit stratum. The strata needed to be consistent with the geographic disaggregation to be used in the survey tables. This sample design is based on the eleven districts of Zanzibar as geographic domains.

Requirements for the Sample Size

The sample was required to be nationally representative, to give district level estimates of poverty, adult-adjusted consumption (AECONS) and total consumption to give rural/urban level estimates. Acceptable accuracies were deemed to be a coefficient of variation²¹ (CV) of less than 5% on the national poverty figure estimate and less than 20% on the district and urban/rural level poverty, AECONS, and total consumption estimates.

Sample Size Calculation

The formula below used to calculate sample size to each desired domain for a required precision (an acceptable precision) with a relative standard error α , for a simple random sampling the net sample size (number of completed interviews/households) needed was given by:

$$n = \frac{(1/P - 1)}{\alpha^2}$$

where,

n is the sample size (households);

P is the poverty figure (in proportion);

α is the desired relative standard error;

The sample size for a complex survey which adopt cluster sample such as the HBS is calculated by inflating the above calculated sample size with a design effect (Deft). Deft is a measure of efficiency of cluster sampling compared to a direct simple random sampling, defined as the ratio between the standard error using the given sample design and the standard error that would result if a simple random sample would have been used. Thus, the net sample size needed for a cluster sampling with relative standard error as per domain requirement was given by:

$$n = \text{Deft}^2 \times \frac{(1/P - 1)}{\alpha^2}$$

where; Deft is the design effect.

The breakdown of clusters along with households and predicted precision level is seen in the table 5.

Sample Size and Allocation

Sample sizes and allocations were created by iterating Excel Solver²² to minimize the total sample size under the coefficient of variation constraints and positivity constraints for each variable of interest. Once calculated, the largest sample size from each stratum was chosen which ensured minimum sample size requirements for

²¹ The coefficient of variation is a scale-invariant measure of variation. It is defined as $CV = \mu/\sigma$.

²² <https://support.office.com/en-us/article/define-and-solve-a-problem-by-using-solver-5d1a388f-079d-43ac-a7eb-f63e45925040>

every stratum for every variable were met.²³ This led to a more efficient sample than the previous HBS, with 2,820 households required amongst 235 EAs. The details of the allocation can be found in Table A.5.

Table A. 5: Determined Sample Size for the Different Domains

Domain	Sample size proposal for 2018/19 HBS					95% Confidence Interval				
	Clusters	HHs	2012 Household Total	HHs per Clusters	Poverty 2014	RSE	Lower Bound	Upper Bound	Width	
National	Rural	137	1644	136,865	12	30.6%	5.4%	35.9%	44.4%	8.6%
	Urban	98	1176	110,527	12	12.5%	11.2%	14.2%	22.2%	8.0%
Kaskazini A		25	300	21,122	12	13.6%	19.9%	13.0%	29.7%	16.7%
Kaskazini B		19	228	15,570	12	16.1%	19.9%	14.2%	32.4%	18.2%
Kati		18	216	16,656	12	19.2%	19.5%	15.6%	34.9%	19.3%
Kusini		15	180	8,953	12	21.5%	19.9%	16.0%	36.4%	20.4%
Magharibi A		36	432	28,520	12	10.4%	19.9%	10.2%	23.2%	13.0%
Magharibi B	District	39	468	39,847	12	9.2%	19.8%	7.7%	17.5%	9.8%
Wete		16	192	20,949	12	38.1%	13.3%	38.3%	65.2%	26.9%
Chake Chake		13	156	18,986	12	41.3%	14.0%	37.8%	66.4%	28.5%
Micheweni		11	132	17,001	12	55.6%	10.3%	53.5%	80.6%	27.1%
Mkoani		14	168	18,067	12	40.8%	13.3%	38.8%	66.1%	27.3%
Mjini		29	348	41,721	12	11.1%	19.2%	12.0%	26.4%	14.4%
National		235	2,820	247,392	12	30.4%	4.9%	27.6%	33.5%	5.9%

When allocating, the main consideration was meeting all precision constraints, with estimates of in-stratum variance calculated using the 2014 HBS data. Table A.6 lists the assumptions used in the calculation of the variance estimates.²⁴

Table A. 6: Assumptions for Determining Sample Size to the Different Domains

Assumption	Justification
Poverty line estimate is accurate.	The poverty line is calculated using the 2014/15 HBS data and is therefore subject to variation as a function of the sample chosen. It greatly simplifies the design if the poverty line is fixed for a year as the official estimate. ²⁵
All variance estimators are distributed normally.	Justified by the central limit theorem. Standard errors are calculated with this assumption.
Intraclass Correlation Coefficient (ICC) calculated using an ANOVA model.	To calculate ICC, the R package <i>ICCbin</i> was used, which utilises an Analysis of Variance model (Paulsen, 2012).
Design effect estimated assuming Primary Sampling Units will be drawn using Simple Random Sampling (SRS).	The formula $Deff = 1 + (m - 1)\rho$, used to calculate the design effect, assumes a SRS, even though a PPS sampling approach was used for this survey. The effects of this should be minimal but it is hard to give an accurate assessment.

The sample selection methodology for the 2019/20 HBS was based on a stratified two-stage sample design. The procedures used for each sampling stage are described separately.

²³ If n_{vh} is the minimum required sample size for a variable v and stratum h , then $n_h = \max_{v \in V}(n_{vh})$.

²⁴ These match those used by the National Bureau of Statistics, Tanzania (NBS) with which the OCGS intends to harmonise its outputs.

²⁵ Strategies that could be used to calculate a more accurate estimate of RSEs would involve complex bootstrapping procedures or making assumptions about distributions and taking convolutions.

First Stage Selection of Sample EAs

Selection probabilities were assigned according to a probability proportional to size (PPS) scheme, so $\pi_{1i} \propto h_i$ where h_i was the number of households in the EA as recorded in the sampling frame. The EAs within each stratum were ordered geographically by ward and EA codes, providing implicit geographic stratification of the sampling frame. This procedure ensures a proportional allocation of the sample by ward within each district. This was done stratum by stratum. In combination with the second stage selection outlined later, this implies that every unit in each stratum having an approximately equal probability of selection. Within each stratum the following first stage sample selection procedures were used:

1. Sort EAs geographically by ward, this led to an implicit proportional allocation by ward²⁶ within each district.
2. Cumulate the measures of size into a sequence (M_i) so $M_i = \sum_{k=1}^i h_k$.
3. Let $I = \frac{M_{n_h}}{n_h}$ and choose a random $r \sim U(0, I)$.
4. Finally, let $S_j = r + I \times (j - 1)$ for $j = 1, \dots, n_h$. Then i is included for every time $M_{i-1} < S_j < M_i$.

Second Stage Selection of Sample households

After the selection of EAs, a household listing was performed in each selected EA using cartographic maps developed during 2012 TPHC. This formed the sample frame for the second stage of selection. Each listing comprehensively lists all households in the EA, which may have changed from the last listing/census. From each EA list, twelve households were chosen by simple random sampling without replacement (SRSWOR). These households will then be interviewed and formed the sample for the survey. A second random systematic selection of four replacement households was drawn for each EA. These households were kept as reserves, only used in the main survey in case it was not possible to interview the original sample households.

Effects of an Increase in the Number of Districts

At the time of the 2014/15 HBS, there were only 10 districts - Kaskazini A, Kaskazini B, Kati, Kusini, Magharibi, and Mjini in Unguja, and Wete, Micheweni, Chake Chake and Mkoani, in Pemba. In 2017, the Magharibi district was split into two districts - Magharibi A and Magharibi B. Estimates of precision for the 2014/15 poverty figures under this new stratification were obtained and, while their RSE's were larger than the singular Magharibi stratum, they still had RSEs < 20%, meaning that a comparative analysis under the new stratification is possible between the two sets of results of 2014/15 and 2019/20.

Non-Response

The 2019/20 HBS was conducted in such a way as to minimize non-response. The team worked closely with community leaders (Shehas) to engage with the communities and minimize refusals as well as attempting multiple visits throughout the survey period to households unoccupied when previously contacted. Some level of non-response is of course unavoidable and so several sampling protocols were utilized. For each EA, 4 replacement households were selected. These households were used *if and only if* several unsuccessful attempts were made to contact the household throughout the survey period. The replacement households were not used for originally sampled households that refused to participate in the survey! As a standard in the HBS tradition, it is not replaced. Instead, an extra weight is used to adjust for refusal.

Weighting Procedures

In order for the sample estimates from the 2019/20 HBS to be representative of the population, it was necessary to multiply the data by a sampling weight, or expansion factor. The basic weight for each sample household was equal to the inverse of its probability of selection (calculated by multiplying the probabilities at each sampling stage).

²⁶ Zanzibar is sorted into a number of geographic domains at various levels. The highest level is national, then Region, District, Ward, and so on.

The sampling probabilities at each stage of selection were maintained in an Excel spreadsheet with information from the sampling frame for each sample EA so that the corresponding overall probability and corresponding weight could be calculated. The overall probability of selection for sample households in the 2019/20 HBS can

$$p_{hi} = \frac{n_h \times M_{hi}}{M_h} \times \frac{m_{hi}}{M'_{hi}},$$

be expressed as follows:

where:

- p_{hi} = probability of selection for the sample households in the i-th sample EA in stratum h
- n_h = number of samples EAs selected in stratum h for the 2019/20 HBS
- M_h = total number of households in the sampling frame of EAs for stratum h
- M_{hi} = total number of households in the frame for the i-th sample EA in stratum h
- m_{hi} = number of sample households selected in the i-th sample EA in stratum h
- M'_{hi} = total number of households listed in the i-th sample EA in stratum h

The two components of this probability of selection correspond to the individual sampling stages.

The basic sampling weight, or expansion factor, was calculated as the inverse of this probability of selection. Based on the previous expression for the probability, the weight can be simplified as follows:

$$W_{hi} = \frac{M_h \times M'_{hi}}{n_h \times M_{hi} \times m_{hi}},$$

where:

- W_{hi} = basic weight for the sample households in the i-th sample EA in stratum h

These weights vary within each stratum based on the difference between the number of households listed in each sample EA and the corresponding number from the sampling frame.

Weighting to Account for Non-response

weight (W'_{hi}) for the sample households in the i-th sample EA in stratum h can be expressed as follows:

$$W'_{hi} = W_{hi} \times \frac{m'_{hi}}{m''_{hi}},$$

where:

- m'_{hi} = total number of valid (occupied) sample households selected in the i-th sample EA in stratum h,
- m''_{hi} = total number of sample households with completed interviews in the i-th sample EA in stratum h, including replacements

Following the listing and data collection for the HBS, the total number of households listed in each sample EA and the final number of household interviews completed, including replacements were added to this file. The original sampled households which could not be interviewed were replaced from the reserve sample of households for each EA.

By the end of the data collection 2,804 households were successfully interviewed for the survey out of the original sample size of 2,820 households. The distribution of the final sample households and sample households interviewed by district is presented in Table A.7. The final response rate for the 2019/20 HBS was, therefore, 99.4 percent.

Table A. 7: Response Rate by District, 2019/20 HBS

District	Total # of Hhld	Total # of Hhld	Response rate	Response rate
Kaskazini A	300	300	100.0	1.00
Kaskazini B	228	228	100.0	1.00
Kati	216	216	100.0	1.00
Kusini	180	179	99.4	0.99
Mjini	348	347	99.7	1.00
Magharibi A	432	430	99.5	1.00
Magharibi B	468	456	97.4	0.97
Wete	192	192	100.0	1.00
Chake Chake	156	132	100.0	0.85
Micheweni	132	156	100.0	1.18
Mkoani	168	168	100.0	1.00
Zanzibar	2,820	2,804	99.4	0.99

Final Population Derived from the Weights

When the POPWEIGHT was applied to the data, the final population figure was **1,625,589**. This population figure is the same as the projected population figure for 2019, and based on the 2.8% population growth rate for Zanzibar, this population figure is reliable (Table A.8).

Table A. 8: Population in Private Households Based on Annual Growth Rate of 2.8%

Year	Population Projection
Year 1 2012 sample frame private households	1,281,551
Year 2 2017	1,579,849
Year 3 2018	1,625,589
Year 4 February 2020 HBS ends	1,625,589 HBS weight
Year 4 By end of year, 2020	1,671,598

Annex A3: Creating the Consumption Aggregate and Estimating the Poverty Lines

A3.1. Calculating the Consumption Aggregate

The Zanzibar poverty estimates are based on aggregate household consumption as the key welfare indicator. As in many other parts of sub-Saharan Africa, consumption is considered a more reliable indicator of welfare than income. Firstly, consumption is typically less fluctuating than income and gives a better and steadier picture of long-term welfare. Secondly, individuals feel more comfortable answering questions related to consumption than to income. Thirdly, income measurement in countries with a large agricultural or informal sector is often highly inaccurate. The consumption aggregate captures both food, and non-food consumption.

A3.2 Food Consumption

Food consumption is based on the food transactions recorded in the 14-day diary (Form V) of the HBS 2019/20. The food consumption aggregate captures food consumed by household members during the day, including consumption from purchases and own-production (section B1) and food consumed outside the household (section B3). Households recorded all food consumed - either the total amount paid (in the cases of purchases) or an estimate of the monetary value in TZS²⁷ (for own produced food and gifts received). Total food consumption sums both actual expenses and estimated monetary values. Food consumption includes the following COICOP categories and consists of 159 different items²⁸.

- 1 Bread and cereals
- 2 Meat
- 3 Fish
- 4 Milk, cheese and eggs
- 5 Oils and fats
- 6 Fruit
- 7 Vegetables
- 8 Sugar, jam, honey, chocolate and confectionery
- 9 Food products not elsewhere classified
- 10 Coffee, tea and cocoa
- 11 Mineral waters, soft drinks, fruit and vegetable juices

A3.3 Non-food Consumption

The non-food consumption aggregate of the HBS 2019/20 captures expenditures on the following goods and services:

- 2 Alcoholic beverages and tobacco
- 3 Clothing and footwear
- 4 Housing, water, electricity, gas and other fuels
- 5 Furnishings, household equipment, maintenance of the house
- 6 Health
- 7 Transport
- 8 Communication
- 9 Recreation and culture
- 10 Education
- 11 Restaurants and hotels
- 12 Miscellaneous goods and services

The recall periods of these items in Form II are 12 months, 3 months or 1 month, based on the assumed frequency of purchase. All spending on non-food goods and services is converted to monthly expenditure. The majority of non-food consumption (unweighted) is based on the non-food recall module (Form II). However, a limited set of small non-food items (matches, washing powder etc.) captured in the diary were added.

²⁷ Estimates of the value of own produced goods and gifts were made by the respondents and so have the risk of being over or underestimated. Interviewers were trained to double check estimates that seemed unrealistic.

²⁸ Alcoholic beverages, as usual, were categorised as non-food.

A3.4: Exclusions from the Consumption Aggregate

The consumption aggregate **excludes housing related expenditures, neither actual rent or imputed rental values for home owners.** The rental market in Zanzibar is limited. For instance, in urban areas only 12.0 percent of the HBS 2019/20 households reported renting their accommodation and in the rural areas, the rental market is virtually non-existent with only 1.7 percent of the HBS households renting their home. Therefore, it was decided not to impute a value for rent as the final consumption amount would not realistically reflect an actual amount in money terms that could be used for consumption by households as, by and large, there is no rental market in Zanzibar.

The consumption aggregate also excludes **use values for large durable items** but it does include the purchasing values of a fairly large number of smaller, semi-durable goods.²⁹ It would be possible to ask questions on HBS to capture the change in the value of the asset over time plus their opportunity cost. However, the Zanzibar 2019/20 HBS was not designed to capture annual flow-of-value of assets as it was felt it would over-burden respondents.

Finally, **household level investments** from Section 10 of Form II (purchase of houses, apartments, garages, payments for hiring labour for own construction, expenditures on ceremonies such as weddings, funerals, business expenditures etc.) were also excluded.

A3.5: Normalising Consumption for Differences in Household Composition

Consumption in HBS is captured at the level of household, not at the individual level. As households in Zanzibar differ in size, composition and cost of living, a simple comparison of consumption between households can be misleading. Household consumption can be divided by household size to reflect per-capita consumption; however, this doesn't take into account the composition effects as consumption levels may depend on the presence of children, women and elderly.

To measure the effects of different consumption needs by different household members depending on age and gender the data is converted into *adult equivalent (AE)* using the sum of adult equivalent measure of each household member. To normalise total household consumption for differences in household size and composition and to adjust for differences in consumption needs between children and adults the following equivalence scale is used:

Table A3. 1: Coefficients for Adult Equivalent Scale

Age (years)	Male	Female
0-2		0.40
3-4		0.48
5-6		0.56
7-8		0.64
9-10		0.76
11-12	0.80	0.88
13-14	1.00	1.00
15-18	1.20	1.00
19-59	1.00	0.88
60+	0.88	0.72

²⁹ The distinction between durables, semi-durables and non-durable items is based on UNStats.un.org official COICOP classification in which ND=Non-Durable, SD=Semi Durable and D=Durable.

A3.6: Normalising consumption for number of days in the household during last 14 days

An adjusted adult equivalent measure was estimated to take into consideration the number of consumption days in the survey month in which the particular member was present in the household. More precisely, the adult equivalent measure in the 2019/20 HBS was weighted by the ratio of days of presence in the household over 14 days, which is the number of days for which the diary was filled. For example, if the member was present for only 7 days out of 14 during the survey, then the adult equivalent measure of that member was multiplied by 7/14 or by 0.5.

$$AEQ_adjusted_ind = AEQ * \text{Number of presence days} / 14.$$

The final adult equivalent consumption of the household was then estimated as follows:

$$\text{Consumption_adult_equivalent} = \text{food consumption} / AEQ_adjusted_hh + \text{Non-food consumption} / AEQ_hh$$

A3.7: Normalising Consumption for Differences in Cost of Living

Individuals living in different locations and surveyed during different periods may pay different prices for similar goods. When comparing standard of living across locations and time period using a consumption-based measure of welfare, such differences in cost-of-living need to be taken into account. Using nominal consumption that does not take into account spatial and temporal price variation may lead to underestimation of poverty in the areas where the prices are higher as well as to overestimation of poverty in areas where the prices are lower. A similar logic is valid for temporal differences.

Therefore, the consumption aggregate is adjusted for variation in the prices of food across **regional and rural-urban locations and the survey quarter**. The prices are based on reported quantities and total value of purchased goods in the HBS 2019/15. The constructed indices reflect the cost of consumption basket relative to the national median prices during the survey period.

Table A3. 2 Spatial and Temporal Price Indices across Region, Area and Survey Quarter, 2019/20 HBS

Region	Area	Q1	Q2	Q3	Q4
		03-05.2019	06-08.2019	09-11.2019	12-02.2019/20
Kaskazini Unguja	Rural	0.99	0.99	0.99	.99
	Urban	1.00	1.00	1.01	1.00
Kusini Unguja	Rural	0.97	0.97	0.97	.97
	Urban	1.01	1.01	1.01	1.02
Mjini Magharibi	Rural	1.04	1.04	1.04	1.04
	Urban	1.03	1.03	1.03	1.03
Kaskazini Pemba	Rural	0.92	0.92	0.92	.92
	Urban	0.95	0.94	0.93	.93
Kusini Pemba	Rural	1.00	1.00	1.00	1.00
	Urban	1.02	1.02	1.01	1.02

The OCGS uses the Fisher ideal index to deflate nominal consumption. Fisher price indices do a better job than Laspeyres or Paasche price indices at capturing differences in consumption patterns across domains as a consequence of differences in relative prices. They also avoid overstating or understating the true inflation (as it would be the case with Laspeyres and Paasche respectively). Separate food and non-food fisher price indices are estimated by the five regions and rural/urban and quarter (a period of three consecutive months) according to the following formula:

$$F_i = \sqrt{L_i P_i}$$

Where i is a combination of stratum and quarter, L refers to a Laspeyres price index and P refers to a Paasche price index. The Laspeyres and Paasche price indices are defined as:

$$L_i = \sum_{k=1}^n w_{0k} \left(\frac{p_{ik}}{p_{0k}} \right)$$

$$P_i = \left[\sum_{k=1}^n w_{ik} \left(\frac{p_{ik}}{p_{0k}} \right)^{-1} \right]^{-1}$$

Where w_{0k} is the average household budget share of item k in the country, w_{ik} is the average household budget share of item k in stratum and quarter i , p_{0k} is the national median price of item k and p_{ik} is the median price of item k in stratum and quarter i .

It should be noted that all prices that feed into the deflators are computed as unit values (value/quantity) from the HBS 2019/20 diary. The HBS food diary has six different measurement units for food items³⁰ – gram, kilogram, millilitre, litre, piece and unit. Prices are based on the most frequent unit for each item (with grams being converted to kg and ml being converted to litre).³¹

A3.8: Setting the Poverty Lines

The HBS 2019/20 poverty lines are based on a food basket concept and are anchored in nutrition. The HBS 2019/20 food poverty line (TZS 47,541 per adult per month) is based on the cost of a food basket that delivers 2,200 calories per adult per day. The 2,200 calories is the amount of dietary energy per adult equivalent that is considered adequate to meet the energy needs for maintaining a healthy life and carrying out light physical activity (FAO). Consumed quantities are converted into calories using the OCGS calorie conversion factors³² and valued at national median prices (the same as the reference for the Fisher deflators).³³

The cost of buying 2,200 calories is derived from the food consumption patterns prevailing in a reference population. The choice of the reference population for the minimum food basket is a normative judgment in the construction of a poverty line and guided by the expectation that it:

- corresponds approximately to the population of households near the poverty line
- reflects food consumption that is near the poverty line
- reflects a minimum food basket that is not too poor and not overly rich.

³⁰ The diary includes “metre” and “pair” but these measures were never used.

³¹ If the household consumed the food item in a unit that does not have a metric conversion to the most frequent unit (e.g. piece to kg) the respective price is not used for the computation of the deflator. For most items the most frequent unit is kg or litre, but there are some exceptions (e.g. eggs overwhelmingly being consumed in units).

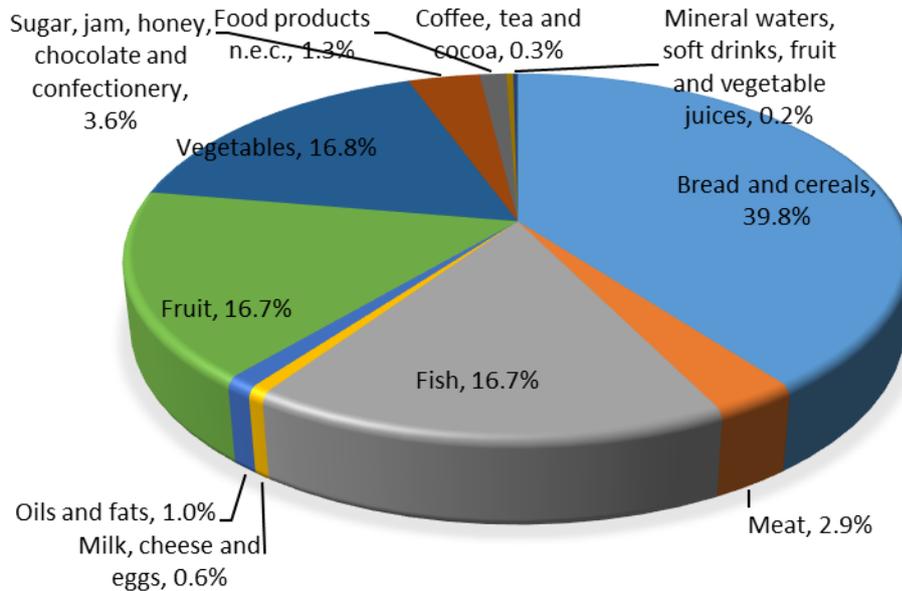

³² See SPSS file Calories.sps.

³³ As in the context of the Fisher price deflator, only transactions in the most frequent unit are used for the computation of median prices and to derive the budget shares.

The food basket of this group is designed to capture the food consumption patterns for a relevant, relatively low-income population. Specifically, **for the HBS 2019/20 analysis, the second, third and fourth population deciles of the per Adult Equivalent Consumption were used as the reference population for setting up the**

Minimum Food Basket. Figure A3.1 illustrates the composition of the cost of food consumed by the reference population based on 159 main food items including non-alcoholic beverages for achieving 2,200 calories a day per adult.

Figure A3. 1: Composition of the Food Poverty Line (share of cost)

An examination reveals that the main food items in the basket are bread and cereals, vegetables, fruits and fishes. Figure A3.2 illustrates the composition of the 2,200 calorie food basket based on the share of calories.

Figure A3. 2: Composition of Food 2,200 Kcal minimum food basket (share of calories)

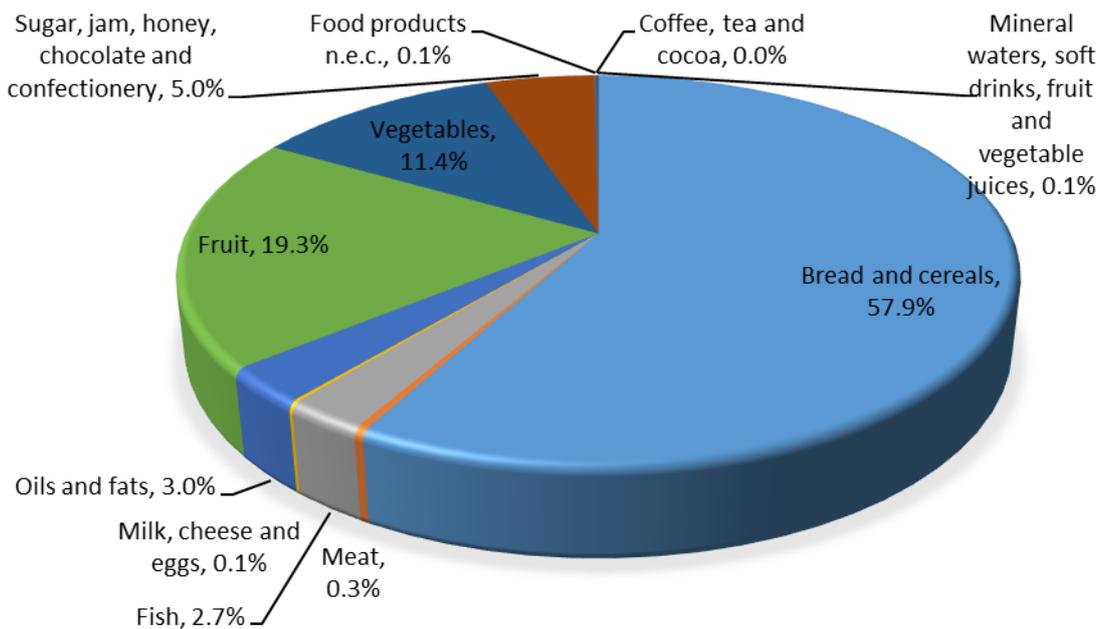

Figure A3.2 clearly shows that over half (53.0 percent) of the calories in the consumption basket of the reference population (deciles 2-4) were obtained from so called “cheap calorie” food items such as rice, bread

and other cereals. It can also be observed that the share of fish and meat by cost is higher than their share by caloric value, a reflection of the fact that fish and meat are “expensive calorie” food products.

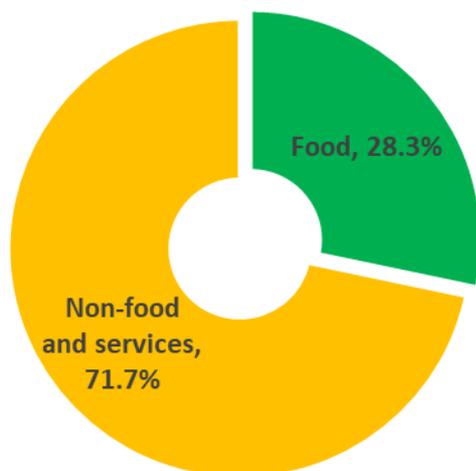

The estimated food poverty line is simply 2,200 times the cost of one kilocalorie for a reference population. The cost of the food basket was estimated at **TZS 47,541 per adult per month**.

Having set the food poverty line, the next step is to estimate an allowance for basic non-food goods to obtain the total poverty line. The lower bound method for estimation has been used, firstly selecting a reference group of households whose **total consumption per adult equivalent is close to the food poverty line**. The *share* of total consumption that goes to food consumption is calculated for this reference group. This share is the ‘allowance’ for non-food consumption that is added to the value of the food poverty line to get the complete poverty line as follows:

$$\text{Total Basic Needs Poverty Line} = \frac{\text{Food Poverty Line}}{1 - \text{Share of non food}} = \frac{\text{Food Poverty Line}}{\text{Share of food}}$$

The share of food for this reference group is **71.7%**. The value of total basic needs poverty line is estimated by dividing the value of food poverty line TZS 47,541 by food share 0.717. The value of the basic needs monthly poverty line is **TZS 66,313 per adult equivalent per month**.

Figure A3. 3 : Composition of the Basic Need Poverty Line, 2019/20 HBS

Box 1: Methodological Comparison of HBS 2019/20, HBS 2014/15 and HBS 2009/10 poverty estimates?

- A 14-day diary was administered for the 2019/20 HBS instead of the 28-day diary that was administered during the 2014/15 HBS.
- The 2019/20 HBS has the most disaggregated COICOP coding for food items
- The 2019/20 HBS used Computer-assisted Personal Interviewing (CAPI) for data collection.
- The 2014/15 HBS and 2019/20 HBS questionnaires used food consumption in the diary in addition to food purchases in order to get more accurate data on *actual household food consumption*.
- In exception of the 2009/10 HBS, the poverty estimates are based on a consumption aggregate which excludes explicit and imputed housing rents, housing maintenance cost, expenditures on durable goods and ceremonies.
- Spatial and Temporal price deflators were derived from 2019/20 and 2014/15 survey data while in 2009/10, the official CPI was used for temporal deflation.

A3.9: Poverty Measures

This report analyses the poverty incidence and poverty depth by using the Head Count Ratio (also called the Head Count Index) and Poverty Gap Ratio (also referred to as an index, and sometimes referred to the Poverty Gap Index).

Head Count Ratio (or Head Count Index) gives the fraction of the population who are below the poverty line. Let q be the total number of people whose income (or consumption) is below the poverty line, and let n be the total population. The Head Count Ratio is given calculated as follows:

$$P_0 = \frac{q}{n}$$

Poverty measured by the Head Count Ratio is also referred to as Incidence of Poverty. Head Count Ratio is the most popular measure of poverty because it is simple and easy to grasp. This measure however does not indicate how poor the poor are. If the level of deprivation increases the Head Count Ratio will not change as long as the percentage of people who are poor remains the same. This characteristic of Head Count Ratio is not desirable; a good poverty index should show that poverty has increased if the income of the poor declines. In order to correct this weakness, another poverty measure called **Poverty Gap Ratio (or Poverty Gap Index)** is used. Let the poverty line be denoted by z . The Poverty Gap Ratio is then calculated as follows;

$$P_1 = \frac{1}{n} \sum_{i=1}^q \left(\frac{z - x_i}{z} \right)$$

The measure captures the average income of the poor and therefore if the income of the poor declines the Poverty Gap Ratio indicates that poverty has increased, and if the income of the poor increases, the Poverty Gap Ratio shows that poverty has declined. This is better than the Head Count Ratio which can remain invariant to changes in the income of the poor whenever the percentage of the poor remains constant.

A3.10 Replicating the Results

The files and syntax for the poverty calculations were created in SPSS. These files are available from OCGS and the eight syntax files **should be run in the following order** to replicate the results presented in this report.

	SPSS SYNTAX FILES	Date of version used	Number of cases
1	1_create hh basic data file	05 Oct 2020	/
2	2_Food and Nonfood from Diary	05 Oct 2020	/
3	3_Nonfood consumption from FORM2	05 Oct 2020	/
4	4a_cleaning data_food consumption	05 Oct 2020	/
5	4b_cleaning data_food expenditures	05 Oct 2020	/
6	4c_cleaning data_eating out	05 Oct 2020	/

11	8a_Checking and imputing missing daily food	05 Oct 2020	/
12	8b_Checking and imputing main food cons by exp	05 Oct 2020	/
12	8c_Total Consumption	05 Oct 2020	/
13	9a_Food prices and indices_District	05 Oct 2020	/
14	9b_Fisher total index_District	05 Oct 2020	/
15	10_Food basket	05 Oct 2020	/
16	11_Food share and poverty statistics	05 Oct 2020	/

The poverty variables are found in the file Poverty. sav which is generated from running the spss syntax files above. The Basic Need Poverty rate of 25.7 percent is found in variable³⁴ **ps** (poverty incidence) while food poverty (extreme poverty) of 9.3 percent is found in variable **fps**. The data needs to be weighted by the weight variable (final adjusted weight) to replicate these results.

³⁴ For variables ps and fps 0=Non poor and 1=Poor
